## PREFACE

**T**HE present work owes its origin to a long-felt need for a comprehensive treatise devoted to the genus *Habenaria* in North America. It was begun ten years ago in the form of a card catalogue devoted to every species native of the United States and Canada. As the work progressed the absolute necessity of an acquaintance with types became apparent, and in 1905 an effort was made to consult all the material that had a bearing on the subject.

Visits were made to the foremost European herbaria, and loans secured of all the large collections in the United States. From my own herbarium a representative series of specimens was selected for comparison with type material, and from this series individuals were sought for which matched the types in detail. This method not only necessitated close scrutiny of every character, but rendered the specimen ultimately chosen exceptionally valuable for future reference.

In addition to descriptive notes and suggestive sketches, a clear photograph was made of specimens which promised to be of service in the preparation of a monograph. In this work I was assisted by R. G. Leavitt and A. A. Eaton.

In the interpretation of species I have avoided the tendency of some botanists to recognize subspecies as worthy of specific rank. Many years of experience with cultivated orchids, during which slight variations in structure or color were assiduously sought for among thousands of individuals, has convinced me that caution should be exercised in the segregation of species, and that there is danger of rendering the whole structure of systematic botany unwieldy by an inordinate multiplication of slightly differentiated species. Everyone who has paid close at-

## PREFACE

tention to cultivated orchids must realize that while slight distinctions are very serviceable for horticultural uses, they are impracticable for the purposes of systematic botany. Undoubtedly many of these horticultural forms will breed true to type and thus act like species. But should they be given specific rank the orchid flora of the world would be increased tenfold.

Several *Habenarias* are characterized by a strong tendency to produce variations. The temptation to recognize these variations as distinct species may be strong, but I think the best interests of the science are subserved by regarding them as the components of compound species. Slightly modified, the Linnæan conception of a species forms a convenient basis for systematic work. For economic purposes the subspecies is necessary. When it is propagated from pure cultures and carefully labelled, it is of undoubted value.

The greatest difficulties in the present monograph were experienced among recent segregates. In my treatment of these I may have reduced some which further studies of fresh material will reinstate, but at present they appear to be exceptional forms unworthy of specific rank. In several of these segregates the distinguishing characteristics may be found in the flowers of one inflorescence, so that a single specimen will exhibit the floral peculiarities of two described species. Then again, the vegetative characters in the group to which *Habenaria hyperborea* and *H. saccata* belong are extremely variable and unsafe criteria for specific distinction.

In 1904 I made special efforts to obtain in a fresh state, from several localities, large collections of *H. hyperborea* and *H. dilatata*. The specimens were taken from different kinds of soil, from sunny and shady places, and the range of variation was represented as completely as possible. The conclusions based on

## PREFACE

this material convinced me that it is futile to attempt to distinguish centres of variation, or to recognize such species as *Habenaria fragrans*, *Platanthera huronensis*, and *P. graminea*.

The influence of environment is too frequently ignored by those who pay special attention to slight deviations from the condition represented by the type. *Habenaria hyperborea* and *H. dilatata*, which were originally described from plants collected in northern localities, are extremely variable in their vegetative organs. From the characteristic dwarf state met with in the extreme northern part of the range, to the slender or robust tall state common southward, every gradation for a complete series may be found. This fact, in conjunction with the information offered by Gaston Bonnier, is very significant.<sup>1</sup> Bonnier experimented with single individuals which he divided into two. One part of the original plant was grown on the Alps or Pyrenees, the other on low land. In a short time the alpine half assumed the familiar dwarf habit of alpine plants. For an example of the difference between the two halves of a plant treated in this manner, *Helianthemum vulgare* should be consulted in the illustrations of Bonnier's paper.

In the "Evolution of the Orchidaceæ," in the *Orchid Review* (February, 1910), R. A. Rolfe treats the *Habenaria* group under two subtribes, namely, *Gymnadeniæ* and *Habenariæ*, the former having one and the latter two distinct stigmas. He says that *Platanthera* and *Gymnadenia* are sometimes united with *Habenaria*, an arrangement which makes of *Habenaria* one great chaotic aggregate whose characters cannot be defined with any degree of precision. This statement leads to the conclusion that the characters on which the three genera depend for purposes of classification are not sufficiently clear to allow subgeneric

<sup>1</sup> *Ann. Sci. Nat.*, 7 Ser., t. 20.

## PREFACE

characterization under *Habenaria*. This conclusion is palpably incorrect, as the basis on which systematists have relied who have upheld the disjunction of *Habenaria* is the distinctness of these characters. This basis hardly leads to chaos whether adopted or rejected, although it does not simplify classification, as I have attempted to show.

The greater part of the type material of North American *Habenaria* species is to be found in European herbaria. Fortunately the specimens are usually well preserved and serviceable for the purposes of monographic work. The authors of early botanical books, however, were not always precise in designating the exact specimens which formed the basis of their conclusions, so that in many cases it is not possible to discover what may be the type. As a rule their collections do not contain many representatives of a species, and then it is a simple matter to arrive at a decision by a process of elimination. Notwithstanding the extensive correspondence of Linnæus and the number of contributors to his herbarium, it is noteworthy that the few species of North American *Habenarias* which he possessed are with one or two exceptions represented by a single example.

For the student of the native species of the United States the herbaria of the British Museum of Natural History and of the Royal Botanic Gardens at Kew contain rich collections of critical specimens. But both of these herbaria lack extensive series of the forms of a given species.

Of the oldest collections containing American *Habenarias* those of Gronovius and Walter, preserved in the British Museum, are of special interest. The latter, which is bound in book form, contains only a few specimens of critical value.

Of more modern collections Lindley's occupies a unique position. Here again the different species are represented by only

## PREFACE

a few specimens, and it is comparatively easy to pick out the types or individuals of importance. Lindley's practice of drawing the flowers on his mounting-paper constitutes a great aid in the examination of his types, but unfortunately many of his interpretations are faulty and should never be final. A glaring example of this is the drawing on the type sheet of *Habenaria novemfida*, to which I have referred under *H. diffusa*. In this case Lindley drew and described petals as trifold which subsequent examination by Dr. Prain proved to be bifid.

American herbaria are indispensable in any serious work on *Habenaria*, and among these the Gray Herbarium of Harvard University is of incomparable value. In this collection there are numerous types, cotypes, and duplicates of type numbers.

The collections in the Museum d'Histoire Naturelle de Paris are of special worth in a study of Mexican species, particularly those described by Richard in the *Annals de Science Naturelle*. Richard prepared careful drawings of many of his new species, and of these the greater part has been reproduced in this work. The almost total neglect of Richard's types by subsequent authors is inexplicable, and to American botanists the placid disregard of his material by Europeans must prove an unending source of surprise.

In the following monograph I have attempted to assemble all the known species of *Habenaria* which have been attributed to North America. In almost every case I have included the original descriptions. The arrangement of the species tends to show their affinities, although clearness has not been sacrificed in favor of a purely natural sequence.

Special attention has been given to bibliography and geographical distribution. These are of importance in showing the extent of the investigations from which conclusions have been

## PREFACE

drawn and in a measure present original data. Although the part devoted to geographical distribution may be thought unnecessarily full it is of value from two points of view,—it shows the actual distribution of the species as represented by the great herbaria of the country, and serves as a guide to the material on which the monograph depends. The names of the species are not mere transcripts from herbarium labels, but are the result of an actual identification of the specimens cited. In many cases where these were poorly preserved a flower was soaked off for critical examination. Otherwise identifications were made by careful comparisons with type or authentic material, and are reasonably correct. Although great care has been exercised in copying geographical data from labels, it has proved an extremely difficult task to verify the spelling or exact location of obscure towns, rivers, lakes and mountains, and errors in the geographical lists may have arisen through this difficulty or through undecipherable writing. It has not proved practicable to compare the proof with the labels, and herein may lie another source of error in spelling and in citation of numbers.

The illustrations have been prepared with careful attention to accuracy and the floral parts drawn with the aid of the camera lucida. With few exceptions those species have been chosen for illustration which have never been figured before, and in almost every case type or authentic material has been used. In conjunction with the key and the original descriptions the illustrations form the most useful part of the work, and should remove many of the difficulties which attend the identification of obscure or variable species.

Nomenclatorial problems have been troublesome, although not to such an extent as is experienced in other groups of the Orchidaceæ. Absolute priority is a rational basis from which to

## PREFACE

proceed, but it presents numerous difficulties and creates doubts and uncertainty. It gives too much weight to unscientific work. One is never sure of finality. It necessitates researches not only in the literature devoted to the genus under consideration and to allied genera, but even in that devoted to distinct families. When priority sanctions the reinstatement of the name of a genus which has been lost sight of for years because it was originally referred to the wrong family, it not only calls for a close scrutiny of all systematic literature, but demands an examination of the type material of every obscure or insufficiently characterized genus and species. Prolonged effort may ultimately do away with the confusion which the laws based on priority are sure to cause in the beginning, but it is doubtful if the end warrants the means.

If priority is absolute it places a burden on the systematist which must in the end render him indifferent to nomenclature. In the first place actual dates of publication must be known, otherwise priority becomes a misnomer. There are rules which we may follow when in doubt regarding the date of publication of a work, but these rules are arbitrary and useless if accident or other means discover that the date on a title-page is misleading or incorrect. This difficulty is not confined to the older literature of botany. Kränzlin's *Orchidacearum Genera et Species*, for example, bears 1901 on the title-page of the first volume as date of publication. Yet the parts of this volume were issued in 1897, 1898, 1899, 1900, and 1901. If the original covers of the parts are not available Kränzlin's work would be useless in fixing priority of publication. In my copy of Dr. Kränzlin's work the sixteenth fascicle, which contains the title-page and preface, is dated 1897 on the original cover. This fascicle appeared in 1901. Then again botanical periodicals, the parts of which appear monthly, are often inconclusive in settling dates of publication, as a part

# ORCHIDACEÆ

## THE GENUS HABENARIA IN NORTH AMERICA

### INTRODUCTION

THE genus *Habenaria* has undergone a series of changes at the hands of those botanists who have given it special attention until at the present time it is an arduous task to comprehend its rational limits. No two systematists agree in their revisions; and while some have considered the treatment in Bentham and Hooker's *Genera Plantarum* too broad, including as it does the recognized groups of many authors under one general heading, namely, *Habenaria*, others have not been content to reëstablish as genera such subgeneric groups as *Gymnadenia*, *Platanthera*, *Peristylus* and *Cœloglossum*, but have made segregates from several of them. Although there may be excellent reasons both for and against the maintenance of *Habenaria* in the sense in which it was understood by the authors of the *Genera Plantarum*, the weight of authority seems to uphold the broader view. So eminent a student of the Orchidaceæ as Lindley expressed grave doubts as to the validity of the characters on which he admitted as distinct groups *Gymnadenia* and *Peristylus* in his *Genera and Species of Orchidaceous Plants*. In fact it is usually with apologies, doubts, or detailed explanations that authors accept the smaller groups which have been at one time or another put into or removed from *Habenaria*.

It is futile to discuss what are sufficient characters on which to construct a genus, as personal opinion is largely influential and

## ORCHIDACEÆ

as systematists are not in absolute agreement. While a concurrence of opinion may be found in regard to several particular genera, a variance of opinion will exist as to others. Each systematist is likely to attribute to some character a value which his associates fail to recognize. Abstractly there seems to be general agreement among botanists as to the value of classificatory groups, although they differ so considerably in the application of their rules. In his discussion of the classifications used by botanists and zoölogists Herbert Spencer has said that "when aggregating the smallest groups into larger groups and these into groups still larger, they have adopted certain general terms expressive of the successively more comprehensive divisions; and the habitual use of these terms, needful for purposes of convenience, has lead to the tacit assumption that they answer to actualities in Nature. It has been taken for granted that species, genera, orders, and classes, are assemblages of definite values—that every genus is the equivalent of every other genus in respect of its degree of distinctness; and that orders are separated by lines of demarcation which are as broad in one place as another. Though this conviction is not a formulated one, the disputes continually occurring among naturalists on the questions, whether such and such organisms are specifically or generically distinct, and whether this or that peculiarity is or is not of ordinal importance, imply that the conviction is entertained even where not avowed."<sup>1</sup> Furthermore, the same author says that "it is a wholly gratuitous assumption that organisms admit of being placed in groups of equivalent values." And according to the present status of systematic botany this is undoubtedly true, and necessarily so, as the same viewpoint can scarcely be held in regard to all classes of organisms, and as characters which in one family or tribe

<sup>1</sup>*The Principles of Biology.*

## ORCHIDACEÆ

would appear of generic value would hardly appear so in another.

Characters which are to serve for generic distinction are not infrequently chosen with total disregard of specific forms throughout a wide range, and this is most likely to take place in the segregations made from amphigean genera which comprise numerous polymorphic species. In a localized flora made up in great part of vagrants which have become introduced into a country from distant, geographically distinct regions, those systematists who lack opportunity to study in large herbaria where general and fairly complete representations are to be had of the flora of adjacent territory, and who confine themselves to the plants of special geographical regions, are inclined to establish genera on characters which a broad knowledge of a given group would clearly show were scarcely of generic weight.

In southern Florida, for example, we find a remarkable orchid flora largely made up of West Indian immigrants. Here the genus *Epidendrum* is represented by about ten species, belonging to at least six very distinct sections as follows: *Epicladium*, *Encyclium*, *Hormidium*, *Osmophytum*, *Amphiglottium*, and *Euepidendrum*. With their few representatives these sections might well be regarded as distinct genera,<sup>1</sup> and would appear as six very natural groups if no other species outside of Florida were known. Here too a noteworthy occurrence would perhaps justify a still broader treatment, as the single species representing in Florida the section *Osmophytum* has three well developed anthers and is unknown in its normal state in this region. If the components of this triandrous race were recognized, on the basis of the gynœcium, as constituting a distinct genus, we would then have a species which had changed its generic or even its tribal character, while its specific characters remained

<sup>1</sup>*Hormidium* is so recognized.

## ORCHIDACEÆ

unaltered.<sup>1</sup> In other words it would differ only from its West Indian congener in respect to the anthers. That this aberration should be maintained as a variety<sup>2</sup> is clear evidence that in the interpretation of structural deviations, natural affinities when they are clear and self-evident are not to be strained.

The *Habenarias* of Florida on the other hand are few. Those species which belong to the *Ophrydinæ-Habenariæ* of Pfitzer form two fairly distinct sections. One of these sections is represented by a single species, namely, *Habenaria odontopetala* which was originally described as a native of Mexico and which is also known to inhabit the West Indies. This species has been placed in a new genus, described by Dr. J. K. Small as *Habenella*, and characterized by structural peculiarities of the flower. It is but one species of a small American group, nearly related to *Habenaria strictissima* and *H. eustachya*, and differs from other Floridian *Habenarias* in little else except the unappendaged petals and undivided labellum; yet its affinity with those species which have divided petals and a three-parted lip is very evident, as at the base both petals and lip have rudimentary processes.

In striking contrast to the treatment of the genus *Habenaria* which allows the segregation of *Habenaria odontopetala* we have Sir J. D. Hooker's in the *Flora of British India*. "I accept Bentham's view," he writes, "that the genera which he has brought under it [*Habenaria*] cannot be separated from one another by natural or artificial characters. To these *Herminium* should be added, were it not for the consequent disturbance of much nomenclature and the multiplication of synonyms; and so should also be *Diplomeris* and *Hemipilia*, which, though they have recognizable differential characters, these are of less impor-

<sup>1</sup> See T. H. Morgan, *Evolution and Adaptation*, p. 90.

<sup>2</sup> In a recent publication this anomalous *Epidendrum* has been raised to specific rank.

## ORCHIDACEÆ

tance than those of the four last sections here adopted" (namely, *Plectoglossa*, *Diphylax*, *Diphyla* and *Dithrix*).

Almost of the same opinion are King and Pantling, who in the *Orchids of the Sikkim-Himalaya* give the following note in which they refer to *Habenaria* as—

"A genus which should certainly be reduced to the older Linnæan genus *Herminium* were it not for the upsetting of synonymy which this would involve. The older genus consists of about 13 species. *Habenaria* contains about 400! Moreover the distinctions between *Habenaria* and *Orchis* are also mostly arbitrary; and were mere consistency the only object, *Orchis* (a genus of Tournefort) would swallow up not only *Herminium* and *Habenaria*, but also *Diplomeris* and *Hemipilia*."

Cogniaux has supported in his work on the orchids of Brazil<sup>1</sup> the view taken by Bentham, as is indicated by the very full synonymy which he gives under *Habenaria*, and is at variance with the system adopted by Pfitzer in Engler and Prantl's *Die natürlichen Pflanzenfamilien*. Pfitzer, not only admits such genera as *Cœloglossum*, *Gymnadenia*, *Platanthera* and *Perularia*, but separates these from *Habenaria*, and places them in a separate section, the reason for the division depending mainly on the development of the stigmas.

We might expect to find in Lindley's work a rational interpretation of the *Habenarieæ*, as his prolonged study of the orchid family must have placed him on intimate terms with a large number of species. According to the views expressed by him in his *Genera and Species of Orchidaceous Plants* he was of the opinion that *Habenaria* as generally understood included several clearly marked genera. We find him arguing in a circle, however, and must conclude that he was by no means confident

<sup>1</sup> In *Martii Fl. Bras.*

in his deductions. Under *Platanthera* he wrote, in reference to the recognition by Robert Brown of a section based on the anthers: "The genus has to depend upon another distinction, to which I can discover no exception, namely, to the absence of the fleshy processes of the lower lip of the stigma. Otherwise *Platanthera* is the same as *Habenaria*." Yet in his discussion of *Gymnadenia* we find the following, which in conjunction with his remarks on *Platanthera* is of more than casual interest: "It is scarcely possible to find any very precise limits between this genus and *Platanthera*. . . . Even the stigmatic processes of *Habenaria* and its allies are to be remarked in almost every species of *Gymnadenia*; only in most cases in adhesion with the stigma itself." If we examine the distribution of species among the several genera Lindley admitted in his work, we shall find inconsistencies, the most astonishing being those where he places the same species in two genera. The difficulties under which he worked may excuse such slips, but at the same time it is quite pardonable to use this example to illustrate the dangers into which fine distinctions may lead, and as an argument against segregation of genera based on trivial or obscure characters.<sup>1</sup>

Among the subgenera of *Habenaria* which have the best claims for recognition, if we are to rely on the authority of Lindley, Pfitzer and Kränzlin, *Gymnadenia*, *Platanthera*, *Peristylus* and *Cœloglossum* occupy an important place. If we study these genera, not as convenient categories, but as systematic groups and examine carefully the species distributed among them, the first incongruous discovery will be the lack of agreement as to what species they should contain. This diversity is of a nature to discourage any effort to uphold a single one of these

<sup>1</sup>It is of interest to note that Kränzlin refers to the synonyms of *Platanthera fuscescens* the following species which Lindley regarded distinct from each other: *Platanthera herbiola*, *Peristylus virescens*, *Perularia flava*.

## ORCHIDACEÆ

genera. While Lindley, Pfitzer and Kränzlin agree that *Gymnadenia* and *Platanthera* should be upheld, these authors are not in accord as to many of the species which should be referred to them!

The species which Lindley included in *Cœloglossum*, Kränzlin places in *Peristylus*, *Platanthera* and *Euhabenaria*. He also refers to *Orchis*, *Peristylus* and *Platanthera*, species included by Lindley in *Gymnadenia*. Pfitzer, on the other hand, throws *Peristylus* into *Platanthera*. *Habenaria viridis* is placed in *Peristylus* by Lindley, in *Platanthera* by Kränzlin, and in *Cœloglossum* by Pfitzer. Pfitzer gives *Cœloglossum* as a monotypic genus, Lindley placed five species in it, and Kränzlin abandoned it altogether in his *Orchidacearum Genera et Species*. Pfitzer upholds *Perularia*, Kränzlin reduces it to *Platanthera*. Numerous similar examples of disagreement could be cited to show the slender claim for recognition of *Gymnadenia*, *Platanthera*, *Peristylus* and *Cœloglossum*. It is at least reasonable to assume that genera which are so poorly differentiated that the same species may be referred to several of them by careful students of the orchid family are scarcely tenable in a rational and convenient system of classification.

We are indebted for the most recent revision of a part of the genus *Habenaria* as represented in North America north of Mexico to Dr. P. A. Rydberg of the New York Botanical Gardens. Dr. Rydberg has gone farther than any other author of modern times in the splitting up of the genus, and has given us several new segregate genera. He is not at all in sympathy with the conservatism of Bentham and Hooker, Torrey, Gray, Cogniaux and others, and is much opposed to the maintenance of large groups which in any way may be divided. An illustration of what I mean may be obtained from Britton's *Manual of the*

## ORCHIDACEÆ

*Flora of the Northern States and Canada*, for which Dr. Rydberg prepared a revision of the Orchidaceæ. In this work eighteen species are admitted which were formerly included by Gray, and Britton and Brown, in the genus *Habenaria*. Dr. Rydberg has distributed these species among seven genera, of which three by him are newly established. The characters on which he relies for the distinctiveness of these genera are not clearly drawn, so that it is difficult to discuss their claim for recognition, and in his key he makes use of differences which would seem to be rather specific than generic.

Perfect agreement as to the final treatment of *Habenaria* is hardly to be expected, but it is a fair question to ask if the reasons which influenced Bentham, Gray and Torrey are not as valid to-day as they were thirty years ago, and if, on the whole, they were not pretty good reasons. Furthermore, it is fair to ask if the host of species described since 1840 has thrown new light on the subject which makes invalid the reasoning of Bentham in the *Journal of the Linnæan Society*. With regard to Bentham's argument it may be said that nothing so convincing has been put forth by those botanists who have disagreed with him.

The following from Bentham's notes on orchids will show clearly the basis for the treatment of *Habenaria* in the *Genera Plantarum*.

“*Habenaria*, Willd., is now a vast cosmopolitan, and in many respects polymorphous, genus, of which there are about three hundred and fifty species in the Kew herbarium, and perhaps fifty more, already published, are not there represented. The differences observed in the anther-cells, in the stigma, and in various appendages to parts of the flower are so great that numerous attempts have been made to dismember it; but the single characters assigned have all proved either so variable from spe-

## ORCHIDACEÆ

cies to species, or so little in accordance with any other distinction, that I feel compelled to reunite the proposed genera after the example of A. Gray and some other recent botanists, although I cannot go so far as to agree with Grenier and Godron in uniting the whole genus with *Orchis*. As it is, I have had to record no less than twenty-eight generic synonyms; and in proposing to distribute the species into the following ten sections I cannot but feel considerable doubts as to the definiteness of the characters assigned to some of them, these characters being often very difficult to ascertain in dried specimens, the only ones I have had to work upon.”

Of the ten sections mentioned above, nine and ten are represented by *Platanthera* and *Habenaria*. Of these sections Bentham says: “*Platanthera* and *Habenaria* proper, comprise the great mass of the genus which most botanists consider as being susceptible of distribution into two great groups; but the various characters assigned have broken down in detail, and it would require a much longer study than I have been able to give to them, especially from dried specimens, to ascertain the real value of several apparent distinctions. It would appear, however, that *Platanthera* might be made to include the great majority of northern temperate species with the lateral processes of the stigmatic apparatus rarely much developed; and the more tropical species, with these processes usually, but variously, extended, would form the section *Euhabenaria*, the flowers in the former usually smaller than in the latter.”<sup>1</sup>

The species of *Habenaria* which constitute a very distinct part of the orchid flora of North America are surprisingly few in relation to the territory over which they are distributed. With

<sup>1</sup> For this and the preceding quotation see Bentham, “Notes on Orchideæ,” *Journ. Linn. Soc.* 18: 353-355.

## ORCHIDACEÆ

several exceptions they are very clearly differentiated, and as to their specific characters offer no perplexing problems. The species in the western United States which Dr. Rydberg referred to *Piperia* have been variously treated, so that at present several are recognized which in my studies I have not considered specifically distinct. In Mexico the small group composed of *H. clypeata*, *H. lactiflora*, *H. Schaffneri*, *H. jaliscana*, and a few others, is perplexing and later may be regarded very differently as more material helps to clarify obscure relationships. That these species are puzzling will be keenly felt by any student who attempts to distinguish them by means of an analytical key. Almost every character which at first appears to differentiate them will be found occurring sporadically here and there in individuals of several of the other species. The relation borne to the middle lobe by the lateral lobes of the trifid labellum would have to be relied on to some extent, though it is not at all constant. Yet it is inconceivable that any serious student would combine these species as variants of one polymorphic species.

Up to the time of his death Mr. A. A. Eaton rendered valuable assistance toward the construction of this monograph and devoted his attention to the bibliography and to the distribution of the species. His notes are incorporated in the body of the work and may be distinguished by the initial letters of his name. His examination of the specimens preserved at Paris, which were described so inadequately by Richard, proved a vast help in the interpretation of obscure Mexican species. During his work at the Muséum d'Histoire Naturelle de Paris he obtained clear photographs of all the *Habenarias* collected by Galeotti, and identified our specimens by careful comparisons with the types. Through the kindness of Sir W. T. Thiselton-Dyer, Mr. Eaton and I were enabled to compare our material with the

## ORCHIDACEÆ

specimens in the Kew Herbarium, where we settled many of the perplexing questions relating to the species included in Lindley's *Genera and Species of Orchidaceous Plants*.

In the citation of specimens the numbers in parentheses after each locality indicate the herbaria in which the material was found. The following is a list of the herbaria loaned to me or which have been consulted, with the numbers used to designate them in the lists of distribution.

## ORCHIDACEÆ

### ILLUSTRATIONS OF THE SPECIES FOUND IN MEXICO BY GALEOTTI

These illustrations were originally prepared by A. Richard. They are here reproduced from photographs, permission to use them having been given by the director of the Muséum d'Histoire Naturelle de Paris. The general outline and critical details have been copied with extreme care. To make the copies as accurate as possible no attempt was made to reverse some of the drawings on the etched plates, consequently the flowers in the prints face in the opposite direction from the originals. Had they been so constructed that they would face in the same direction, the details, shading, etc., would have been reversed during transference to the copper plates and the likelihood of error intensified. No attempt has been made to secure facsimile reproductions from the original drawings.

KEY TO  
THE NORTH AMERICAN SPECIES OF  
HABENARIA<sup>1</sup>

I. Plants essentially northern in their distribution. *Stigmatic processes* wanting or much reduced and inconspicuous (cf. *H. clavellata*, *H. integra*, *H. nivea*). Petals simple, not bipartite. *Labellum never divided into three filamentous or linear divisions*. In this section belong *Gymnadenia*, *Perularia*, *Piperia*, *Limnorchis* and *Cœloglossum*, often recognized as distinct genera.

\*Labellum not fringed, if crenate not tripartite (cf. *H. peramœna*)

†Stem usually leafy. Leaves not basal, or if basal linear (cf. *H. nivea*)

Lip 2-3-toothed or lobed at the apex, not hastate, flowers greenish

Spur shorter than the lip

1. *H. viridis*

var. *bracteata*

Spur longer than the lip

2. *H. clavellata*

Lip 3-lobed or trifid, flowers white

3. *H. albida*

Lip hastate with a tubercle at base, flowers green

4. *H. flava*

Lip crenate on the margin, flowers yellow

5. *H. integra*

Lip narrowly oblong, flowers white

6. *H. nivea*

Lip rhombic-lanceolate, dilated at base, acuminate, flowers white or yellowish green

Spur about equalling the lip

7. *H. dilatata*

var. *media*

Spur longer than the lip

var. *leucostachys*

Lip lanceolate, not conspicuously dilated at base, flowers greenish,<sup>2</sup> spur not con-

<sup>1</sup>In strict accordance with priority *Satyrium* would become the valid name for this genus. I have not adopted it, as to do so would be an indirect violation of the spirit of the Vienna Rules. Harms's List retains *Platanthera*, which is clearly referable to *Satyrium*.

<sup>2</sup>*H. hyperborea* passes by insensible gradations into the section characterized by a linear labellum. The key is based on normal conditions of the flower. In *H. hyperborea* the flowers are usually in a dense cylindrical spicate raceme. In *H. saccata* and *H. sparsiflora* the flowers are in an elongated, slender raceme.

## ORCHIDACEÆ

- spicuously longer than the labellum (cf. *H. volcanica*) 8. *H. hyperborea*  
 var. *purpurascens*
- Lip lanceolate, spur stout, longer than the lip 9. *H. behringiana*
- Lip linear or nearly so, dilated or lanceolate in *H. volcanica* which has an elongated filiform spur
- Spur saccate, shorter than the lip 10. *H. saccata*
- Spur about equalling the lip or slightly longer
11. *H. Richardii*
12. *H. Ghiesbreghtiana*
13. *H. nubigena*
14. *H. sparsiflora*
- Spur much longer than the lip
- Leaves reduced
- Leaves elongated
15. *H. brevifolia*
16. *H. volcanica*
17. *H. limosa*
- †† Leaves basal, rarely more than two, soon withering in 18 and 19
- ¶ Leaves twice as long as broad or longer, oblong or oblanceolate, never linear or grasslike
- Spur more than twice as long as the lip 18. *H. elegans*  
 var. *maritima*
- Spur about equalling the lip
19. *H. unalascensis*
20. *H. obtusata*
- ¶¶ Leaves rarely twice as long as broad, often orbicular
- Lip oblong, longer than the spur 21. *H. Chorisia*
- Lip lanceolate, acute 22. *H. Hookeri*
- Lip oblong-ligulate
- Spur 1.5–2 cm. long 23. *H. orbiculata*
- Spur 3–4 cm. long 24. *H. macrophylla*

## ORCHIDACEÆ

\*\* Labellum fringed, but not tripartite (here hybrids may be looked for)

Flowers yellow

Spur 5-9 mm. long

25. *H. cristata*

Spur 2-2.5 cm. long

26. *H. ciliaris*

Flowers white

27. *H. blephariglottis*  
var. *conspicua*

\*\*\* Labellum fringed, tripartite (here hybrids may be looked for)

Flowers greenish or whitish

Petals entire or obscurely crenulate

28. *H. lacera*

Petals toothed or crenate

29. *H. leucophæa*

Flowers pale or deep magenta

30. *H. psycodes*

31. *H. fimbriata*

32. *H. peramaena*

II. Plants essentially tropical or subtropical. *Stigmatic processes* well developed, conspicuous.<sup>1</sup> *Petals often bipartite*. Labellum usually broken up into three *linear* divisions. The majority of the species are Mexican and West Indian.

\* Labellum clearly tripartite, the divisions filiform or linear

† Petals bipartite, the posterior division broader than the anterior one

‡ Leaves basal

33. *H. distans*

34. *H. jamaicensis*

35. *H. Türkheimii*

‡‡ Leaves not essentially basal, usually with parallel sides, oblong to linear, clearly longer than broad

Flowers few, not more than 4, rarely 5

36. *H. setifera*

37. *H. mesodactyla*

Flowers comparatively numerous, more than 4

<sup>1</sup>Cf. plate of *Habenaria quinqueseta*.

ORCHIDACEÆ

- Spur not exceeding 2 cm. in length  
 Middle division of the labellum longer  
 than the laterals 38. *H. Leprieuri*  
 Divisions of the labellum subequal 39. *H. Cruegeri*  
 40. *H. repens*
- Spur exceeding 2 cm. in length  
 Lateral sepals about 2 cm. in length 41. *H. Pringlei*  
 Lateral sepals less than 2 cm. in  
 length 42. *H. bicornis*
- ¶¶¶ Leaves not essentially basal, ovate to lance-  
 olate, not much longer than broad, not ob-  
 long in the sense of having parallel sides  
 † Petals bipartite  
 Spur usually exceeding 10 cm. in  
 length, about 8 cm. long in the  
 variety 43. *H. macroceratitis*  
*var. brevicarata*
- Spur not exceeding 10 cm. in  
 length, not less than 4 cm. long  
 44. *H. lucæcapensis*  
 45. *H. quinquieseta*  
 46. *H. oreophila*
- Spur not exceeding 4 cm. in length  
 Stems maculate 47. *H. monorrhiza*  
 Stems not maculate  
 Divisions of the labellum glandu-  
 lose or minutely denti-  
 culate 48. *H. crassicornis*  
 Divisions of the labellum com-  
 paratively smooth, not  
 denticulate

ORCHIDACEÆ

Anterior division of the petals  
longer than the posterior

49. *H. Schaffneri*  
50. *H. lactiflora*  
var. *buccalis*  
51. *H. clypeata*  
52. *H. entomantha*  
53. *H. jaliscana*  
54. *H. diffusa*

Anterior division of the petals  
shorter than the posterior  
division or subequal to it

Raceme lax

55. *H. flexuosa*  
56. *H. felipensis*  
57. *H. guadalajarana*

Raceme dense

†† Petals simple, subauriculate on anterior basal  
angle

58. *H. subauriculata*  
[*H. virens*<sup>1</sup>]

\*\* Labellum simple, or merely lobed or toothed, the  
lateral lobes, if any, never filiform or linear  
except in *H. virens*

† Petals bipartite

59. *H. orizabensis*

†† Petals simple or merely angled, or toothed on  
the anterior basal angle or at the summit

Labellum rounded at base, not toothed  
or angled  
Spur slender

60. *H. stricta*  
61. *H. eustachya*  
62. *H. troyana*

Spur inflated

<sup>1</sup> *H. virens*, which has a trifid labellum, may be looked for here. It belongs, however, with *H. odontopetala* and its allies.

## ORCHIDACEÆ

Labellum angled or toothed at the base  
or near the middle

Leaves linear to linear-oblong

63. *H. replicata*

64. *H. triptera*

Leaves oblong-lanceolate

Petals cuneate, truncate, not  
toothed on the anterior basal  
angle

65. *H. petalodes*

Petals oblong, not toothed on  
the anterior basal angle

66. *H. Sclerorum*

67. *H. brevilabiata*

Petals subquadrate, the anterior  
basal angle protuberant or toothed

68. *H. odontopetala*

69. *H. Purdiei*

Petals ligulate, anterior basal  
angle protuberant

70. *H. Oerstedii*

Petals spatulate

71. *H. virens*

Petals rotundate-square

72. *H. strictissima*

Petals lanceolate

73. *H. alata*

74. *H. socialis*

75. *H. Dussii*

## HABENARIA<sup>1</sup>

*Platanthera viridis* *Finet*, in Bull. Soc. Bot. Fr. 47: 284 (1900).—*P. Chorisiana* *Kränzl.*, Orch. Gen. et Sp. 1: 615 (1899) as to characters of the labellum and fig. in *Reichb. f.* Orch. Eur.

“\* 56. ORCHIS *bracteata*.

“O. labello lineari apice bifido, petalis subconniventibus, lateralibus ovatis latioribus, cornu obtuso scrotiformi, bracteis flore duplo longioribus patentibus. W.

“Orchis *bracteata* *Mühlenberg* in litt.

“Beblätterte Ragwurz. W.

“*Habitat* in Pennsylvania (*v. s.*)

“*Radix palmata*. Caulis *spithamæus*. Folia ovata reticulata, facie et magnitudine *epipactidis latifoliæ*. Flores virides paulo majores quam in præcedente.<sup>1</sup> Petala tria superiora conniventia, bina lateralia duplo latiora ovata recta. Labellum lineare dependens, apice bifidum cum mucrone parvo obscuro inter lacinas, sæpius deficiente. Cornu obtusum brevissimum scrotiforme. Bracteæ oblongo-lanceolatæ flore duplo, quandoque triplo fere, longiores patentibus. W.” Willd. loc. cit.

<sup>1</sup> *Orchis viridis*.

## ORCHIDACEÆ

*H. viridis* That the North American plant is distinct from the *Habenaria viridis* of the Eastern Hemisphere is not clear. Lindley regarded his specimens from Siberia identical with those from North America. Reichenbach referred *Orchis bracteata* Willd. to *Platanthera viridis* as var. *bracteata*, and characterized it by the elongated floral bracts.

### NOVA SCOTIA

Boggy spots near Island Pond, Sable Isl., July 26, 1899, *J. Macoun* (6).

### NEW BRUNSWICK, VICTORIA COUNTY

Mountain back of Clair's, July 11, 1904, *A. A. Eaton* (no. 92) (1).

### QUEBEC, OTTAWA COUNTY

In woods, Buckingham, May 11, 1903, *J. Macoun* (6).—Woods, Chelsea, May 22, 1891, *Macoun* (6).

### KEEWATIN

Mouth of Albany River, James Bay, July 25, 1904, *W. Spreadborough* (6).

### ONTARIO, NIPISSING DISTRICT

In woods, Rainy Lake, June 12, 1900, *J. Macoun* (6).

HASTINGS Co.: Rich woods, rather scarce, near Belleville, June, 1865, *J. Macoun* (1, 6).—In damp woods, June 10, 1872, *Macoun* (6).

YORK Co.: Scarborough, June 1, 1898 (Biltmore 6370a) (5).

WELLINGTON Co.: Puslinch Lake, July 16, 1904, *A. B. Klugh* (1).

### MANITOBA

In damp thickets, Strong Mt., June 4, 1896, *J. Macoun* (6).—In woods, Rat River, Otterburne, June 1, 1896, *Macoun* (6).—Brandon, June 13, 1880, *Macoun* (6).—Lake Winnipeg Valley, 1837, *Bourgeau* (3).

### ATHABASCA

Open prairies, Peace River Landing, June 13, 1903, *J. M. Macoun* (1, 6).

### SASKATCHEWAN

In thickets at Prince Albert, June 30, 1896, *J. Macoun* (6).

### ASSINIBOIA

In boggy places, Qui Appelle Valley, June 22, 1879, *J. Macoun* (6).—Regina, 1903, *T. N. Willing* (1).—In thickets, Wood Mountains, June 17, 1896, *Macoun* (6).—Moore Mt., July 3, 1880, *Macoun* (no. 173) (3).

## ORCHIDACEÆ

### ALBERTA

*H. viridis*

Meadows behind Tunnel Mt., 4450 ft., July 6, 1899, *W. C. McCalla* (no. 2231) (2, 5).—Athabasca River, June 26, 1898, *W. Spreadborough* (6).—Athabasca River near Lac Brule, June 30, 1898, *Spreadborough* (6).—In grassy thickets, Red Deer, June, 1895, *Gaetz* (6).—Shore of Waterton Lake, South Kootenay Pass, July 28, 1895, *J. Macoun* (6).—Prairies, Kananaskis, June 13, 1885, *Macoun* (6).—Burger's Pass, Yoho Valley, August 27, 1904, *Macoun* (1).—Damp places, only specimen seen, Calgary, June 7, 1897, *Macoun* (6).—Rocky Mountain Park, east of Spray Bridge, Banff, July 11, 1891, *Macoun* (6).—Mountains north of Devil's Lake, July 5, 1900, *N. B. Sanson* (6).—Banff, *Sanson* (1).—Near Banff, July 11, 1891, *Macoun* (2, 3, 4).

### BRITISH COLUMBIA

Telegraph Trail, lat. 54°, June 17, 1875, *J. Macoun* (6).  
YALE DIST.: Northwest of Spence's Bridge, June 6, 1889, *J. M. Macoun* (6).  
VANCOUVER ISL.: Grassy places, Mt. Finlayson, June 18, 1887, *J. Macoun* (6).

### ALASKA

Kyska Harbor, July 19, 1873, *W. H. Dall* (3).—Arakamtchetchene Isl., Bering Straits, Ringgold-Rogers Exp., 1853-6, *Ch. Wright* (3) (*H. viridis?*).—Boggy spots, Bering Isl., September 1, 1891, *J. M. Macoun* (6).—Boggy places, Attu Isl., August 29, 1891, *J. M. Macoun* (6).—Popoff Isl., July 10, 1899, *De Alton Saunders* (no. 3302) (4).—Kadiak, July 1, 1899, *Wm. Trelease* (no. 3300) (4); July 4, 1899, *Trelease* (no. 3301) (4).—Disenchantment Bay, August 12, 1902, *Frederick Funston* (no. 112) (3, 4).

### MAINE

Jemtland, July 16, 1900, *Dr. D. W. Fellows* (1).—Moist wooded slopes of Mt. Aziscoos, July 31, 1903, *B. L. Robinson* (3).—Banks of Wassataquoik River, May, 1837 (Hb. Thurber) (3).  
AROSTOOK Co.: 1903, *F. T. Hubbard* (1).—Fort Kent, July 11, 1904, *A. A. Eaton* (no. 92) (1); hillside woods, July 18, 1904, *Eaton* (no. 169 a) (1).  
PISCATAQUIS Co.: Deciduous woods, Rum Mt., July 5, 1895, *M. L. Fernald* (no. 267) (3, 4).  
FRANKLIN Co.: High woods, Mt. Saddleback, July 16, 1902, *Clarence H. Knowlton* (no. 491) (1).—Bog on Mt. Saddleback, Wilton, August 1, 1899, *L. J. Spalding* (17).

## ORCHIDACEÆ

### *H. viridis* NEW HAMPSHIRE

Near Jack's House, White Mts., June 8, 1881, *Faxon* (3).—Base of White Mountains, *Oakes* (2).

COOS Co.: Mt. Adams, July, 1878, *Faxon* (3).

GRAFTON Co.: Profile House, Franconia, July 6, 1855, *Wm. Boott* (3); Profile House, July 4, 1879, *Faxon* (3).

CHESHIRE Co.: Wooded slope, Gap Mt., Troy, May 30, 1899, *B. L. Robinson* & *E. L. Rand* (no. 723) (3).

### VERMONT, ORLEANS COUNTY

Woods, side of Willoughby Mt., June 18, 1861, *J. Blake* (16).—Woods near Willoughby Lake House, June 27, 1884, *Faxon* (3).—Willoughby Mt., June 6, 1885, *Warren H. Manning* (6).

LAMOILLE Co.: Belding Pond, Johnson, May 23, 1895, *A. J. Grout* (2); Johnson, June 3, 1895, *L. R. Jones* (5).

CALEDONIA Co.: Peacham, June 2, 1884, *F. Blanchard* (4); May 28, 1886, *Blanchard* (4).

CHITTENDEN Co.: Moist woods, Charlotte, May 31, 1886, *C. G. Pringle* (7).—Cold mountain woods, Huntington, June 20, 1876, *Pringle* (7).—Chittenden, August 18, 1895, *W. W. Eggleston* (14).

ADDISON Co.: Cold woods, Monkton, September 24, 1878, *C. G. Pringle* (7).—Lost Pleiad Lake, Hancock, June 10, 1902, *E. Brainerd* (1).—Salisbury, July 26, 1903, *W. W. Eggleston* (1).—Middlebury, June 7, 1879, *Brainerd* (5); May 25, 1878, *Brainerd* (2).

ORANGE Co.: Strafford, July 25, 1891, *L. R. Jones* (5).

RUTLAND Co.: E. Wallingford, July 7, 1898, *W. W. Eggleston* (5, 14).

BENNINGTON Co.: Manchester, June 29, 1898, *M. A. Day* (no. 370) (2, 5).—Chittenden, August 18, 1895, *Eggleston* (14).

### MASSACHUSETTS, MIDDLESEX COUNTY

Pine woods, only specimens found, South Framingham, May 12, 1890, *E. L. Sturtevant* (4).

WORCESTER Co.: Mossy wet nook on the face of a cliff, Rocky Hill, Oxford, 820 ft. alt., May 5, 1900, *Leland J. Spalding* (17).

FRANKLIN Co.: Shelburne, June 28, 1873, *Miss S. E. Anderson* (10).

HAMPSHIRE Co.: South Hadley, 1887, *A. C. Cooke* (2).—Young deciduous woods, South Hadley, May 27, 1905, *R. G. Leavitt* (1).—Northampton, *E. Hitchcock, Jr.* (3).

ORCHIDACEÆ

*H. viridis*

CONNECTICUT, NEW HAVEN COUNTY

Mt. Carmel, near New Haven, June 25, 1884, *W. E. Safford* (2).

NEW YORK, HERKIMER COUNTY

Cold damp woods, July, 1879, *Frank Tweedy* (2).

WASHINGTON Co.: Mt. Hope, Ft. Ann Mts., June 26, 1896, *Stewart H. Burnham* (1).

MONROE Co.: Rochester, May 21, 1863, *Wm. Boott* (3).

ONONDAGA Co.: Woods near Carpenter's pond, Fabius, July 22, 1905, *H. D. House* (no. 1346) (18).

NEW JERSEY, SUSSEX COUNTY

Near Bloom Swamp, Stockholm, August 13, 1895, *Wm. Van Sickle* (2).

WARREN Co.: Delaware Water Gap, July 5, 1875, *Mr. Knipe* (3).

PENNSYLVANIA, CRAWFORD COUNTY

1868, *McMullen* (2).

NORTHAMPTON Co.: Vicinity of Easton, 1868, *A. P. Garber* (2); near Easton, May, 1872, *Thos. C. Porter* (2).

OHIO, LUCAS COUNTY

Toledo, May 18, 1884, *H. A. Young* (3).

LORAIN Co.: Oberlin, May 17, 1895, *W. M. Dick* (1).—Amherst, June 12, 1895, *A. E. Ricksecker* (2).

MEDINA Co.: Woods, Medina, June, 1897, *G. B. Ashcroft* (5); May 30, 1898, *Ashcroft* (14).

ILLINOIS, WINNEBAGO COUNTY

Rockford, May 30, 1888, *Kate C. Penfield* (2).

MICHIGAN, KEWEENAW COUNTY

Woods, August, 1886, *O. A. Farwell* (3).—Clifton, May, 1884, *Farwell* (11).—Moist woods, Keweenaw Point, June 13, 1884, *Frank E. & Floy J. Wood* (2).

MARQUETTE Co.: July 9, 1883, *G. F. A.* (2).—Turin, May 31, 1901, *Bronson Barlow* (1, 2).—Marquette, August, 1868, *Wm. M. Canby* (1, 16).

MACKINAC Co.: Mackinac Isl., June 30, 1889, *G. H. Hicks* (10); June 24, 1888, *Hicks* (2).

IOSCO Co.: Oscoda, June, 1882, *R. A. Barr* (3).

IONIA Co.: Hubbardston, May, 1872, *C. F. Wheeler* (8).

ST. CLAIR Co.: Wet woods, Port Huron, May 31, 1838, *Houghton* (3); August 6, 1893, *Chas. K. Dodge* (no. 104) (3).

ORCHIDACEÆ

*H. viridis* WAYNE Co.: Detroit, May 30, 1895, *Oliver A. Farwell* (11).

WISCONSIN, BROWN COUNTY

June, 1883, *J. H. Schuette* (1).—Bellevue, May 27, 1882, *Schuette* (1).—  
Cedar swamp, May 18, 1878, *Schuette* (1).

MILWAUKEE Co.: Milwaukee, 1843, *I. A. Lapham* (4).

RACINE Co.: Cool woods, shores of Lake Michigan, May 22, 1897, *S. C. Wadmond* (5).

MINNESOTA

Short Line Park, 1889, *F. F. Wood* (2).

HUBBARD Co.: Woods, Park Rapids, June 22, 1891, *J. H. Sandberg*  
(no. 1235) (2).

STEARNS Co.: St. Cloud, September, 1892, *F. W. Dewart* (4).

WINONA Co.: Homer Road near Winona, May, 1886, *J. M. H(olzinger)* (2).

IOWA, FAYETTE COUNTY

Fayette, rare, June, 1893, *B. Fink* (2).

POTTAWATTAMIE Co.: Prairie groves, near Council Bluffs, rare, April 18,  
1839, *Chas. A. Geyer* (2).

NEBRASKA

Banks, etc., along cañon streams, near Bonnet, 5000 ft., June, 1890, *Tom A. Williams* (4).

SOUTH DAKOTA, CUSTER COUNTY

Black Hills, *W. S. Rusby* (10).—Harney Peak, 7000 ft., July 20, 1892,  
*P. A. Rydberg* (no. 1029) (2).

MONTANA

Woods bordering Flathead River, July 27, 1883, *Wm. M. Canby*  
(no. 310) (16).

GALLATIN Co.: Low wet shady woodlands, not rare, Bozeman, June 22,  
1899, *J. W. Blankinship* (1, 4).

WASHINGTON

Cascade Mts., lat. 49°, 1859, *Dr. Lyall* (3).—From Fort Colville to Rocky  
Mts., 1861, *Dr. Lyall* (3).

JAPAN

Sappon, June, 1878 (3).

CHINA

Hu-pe Province, Central China, 1885-8, *Dr. August Henry* (no. 6874) (3).

ORCHIDACEÆ

2. *H. clavellata* (*Michx.*) *Spreng.*, Syst. Veg. 3: 689 (1826); *Sw.*, *H. clavellata* Adnot. Bot. 45 (1829); *Britton & Br.*, Ill. Fl. 1: 463, f. 1104 (1896); *Clute*, Fl. Up. S. ed. 1, 459 (1860), ed. 2, 459 (1884), ed. 3, 485 (1897); *Hervey*, Cat. 21 (1860); *Wood*, Class-book 683 (1861); *Tracy*, Essex Fl. 80 (1892); *Correvoon*, Orch. Rust. 94 (1893).

*Platanthera tipuloides* *Hook.*, Fl. Bor. Am. 2: 195 (1839) in syn.<sup>1</sup>

*Orchis tipuloides* *Hook.*, Fl. Bor. Am. 2: 195 (1839) in syn., not *Fischer* in hb.

*Gymnadenia tridentata*  $\beta$  *clavellata* *Wood*, Class-book 683 (1861).

*Peristylus clavellatus* *Kränzl.*, Orch. Gen. et Sp. 1: 521 (1898), 926 (1901).

*Gymnadeniopsis clavellata* *Rydb.*, in Britton's Man. 293 (1901); *Small*, Fl. Se. U. S. 316 (1903), in Porter's Fl. Pa. 92 (1903); *Lighthipe*, in Torreyia 3: 80 (1903); *House*, in Torreyia 3: 51 (1903); *C. B. Robinson*, in Bull. Pictou Acad. 1: 35 (1907). (See *Habenaria lacera* x *clavellata*, *Niles*, Bog-trotting for Orchids, 257, sub *H. lacera*.)

<sup>1</sup>Hooker (*Fl. Bor. Am.* 2: 195) makes *Platanthera tipuloides* *Lindl.*, *Orchis tipuloides* *L.*, *O. gracilis* *Fisch.* = *Gymnadenia tridentata*, basing his opinion on a fragment of *Fischer's* distribution in his herbarium. *MacMillan* and *Macoun* follow him, but I think he must be entirely mistaken, a view apparently held at *Kew*, for *Index Kewensis* makes *Pl. tipuloides* = *Tipularia Kamtschatica*. (A. A. E.)

## ORCHIDACEÆ

“*O. bulbis tenuiter fusiformibus: scapo oblonge unifolio: spica H. clavellata* laxiuscule pauciflora; bracteis brevibus: calyce minuto, connivente; cornu longitudine ovarii, clavato; labello ovali, integro.

“*Hab. in Carolina.*” Michx. *loc. cit.*<sup>1</sup>

*Habenaria clavellata* is a very distinct species with no near ally in North America. The appendages of the gynostemium are quite characteristic. These are three in number, erect and tuberculate.

### NEWFOUNDLAND

Damp soil, brookside, near Topsail, Conception Bay, August 12–19, 1901, *C. D. Howe & W. F. Lang* (no. 1352) (3).—Swamps, Manuels, August 8, 1894, *B. L. Robinson & H. Schrenk* (no. 167) (2, 3, 4, 6).—Bogs, Chimney Cove, Bay of Islands, July 21, 1895, *A. C. Waghorne* (4).—Low woods, July, 1885, *R. Bell* (6).—Barred Isl., August 28, 1903, *J. D. Sornborger* (1).

### NOVA SCOTIA

Cape Torment, 1825, *Mrs. Shepard* ex Hb. Thurber (3).—In damp, marshy spots, Sable Isl., July 28, 1899, *J. Macoun* (6).

CAPE BRETON Co.: Boggy meadow, Sydney, August 18, 1902, *M. L. Fernald* (1, 3).—Halfway House, August 5, 1898, *J. Macoun* (1, 4, 6).—Damp places, Baddeck, July 24, 1898, *Macoun* (6).—Wet woods, Baddeck, July 18, 1883, *Macoun* (6).—New Campbellton, July 23, 1897, *David White & Chas. Schuchert* (no. 26) (2, 6).

CUMBERLAND Co.: Cold bog, Truemanville, July 25, 1884, *H. Trueman* (3).

GUYSBOROUGH Co.: Damp places, Boylston, July, 1890, *Dr. C. A. Hamilton* (6).

### PRINCE EDWARD ISLAND

Tracadie, August 2, 1888, *J. Macoun* (6).

### NEW BRUNSWICK

August 12, 1869, *J. Fowler* (3).—Bass River, July 21, 1875, *Fowler* (2).

<sup>1</sup>The type in Michaux's herbarium at the Paris Museum is annotated as follows: “*Orchis clavellata, calcare clavato, labello ignoto. Carolina? innominato.*” It would thus appear that Michaux was unfamiliar with the lip of the plant, as suggested by Boott, in a letter to Lindley quoted on pages 277, 278 of *Gen. & Sp. Orch.* (A. A. E.)

## ORCHIDACEÆ

*H. clavellata* NORTHUMBERLAND Co.: Miramichi, August 4, 1892, *Fowler* (4).  
 KENT Co.: August 14, 1869, *Fowler* (16).

### QUEBEC

Island of Anticosti, *Pursh* ("*Orchis oscillata* n. sp.") (3) (ex Hb. Geo. Thurber, Comm. Mrs. Shepard).

### ONTARIO

In a peat bog, Catfish Lake, Algonquin Park, July 23, 1900, *J. Macoun* (6).—White Lake, July 22, 1898 (Biltmore no. 490b) (5).

HASTINGS Co.: Bogs and marshes, North Hastings, July 12, 1878, *J. Macoun* (6).

WELLINGTON Co.: Blueberry marsh, Killlean, July 19, 1904, *A. B. Klugh* (1).  
 —Bogs, Edmonton, August 2, 1890, *Jas. White* (6).

ESSEX Co.: Leamington, August 2, 1892 (6).

### MAINE

Silver Lake, *Scribner*, July 31, 1878 (8).

AROOSTOOK Co.: In sphagnum, Fort Kent, August 11, 1901, *M. L. Fernald* (3).—Bog at Fort Kent, July 17, 1904, *A. A. Eaton* (no. 155) (1).

SOMERSET Co.: Swamps from Stacyville to City Camp, July 17–18, 1900, *M. L. Fernald* (3).—Cedar swamp, Madison, July 2, 1903, *A. A. Eaton* (1).

FRANKLIN Co.: Grassy bog, New Sharon, July 25, 1899, *L. J. Spalding* (17).—Peat bog, New Sharon, August 10, 1902, *C. H. Knowlton* (1).—Grassy wayside, South Chesterville, July, 1903, *Lillian O. Eaton* (1).—Swamp, Strong, August 1, 1902, *C. H. Knowlton* (1).—Moist field, Farmington, August, 1900, *C. H. Knowlton* (1).

OXFORD Co.: Moist woods, Waterford, August 8, 1883, *Blake* (no. 990) (2).  
 —Bethel, July 28, 1865, *Wm. Boott* (3).

HANCOCK Co.: Mt. Desert, July, 1871, *Wm. Boott* (3).—Common in moist grassy places, Mt. Desert, July, 1879, *D. C. Eaton* (3).—Wet roadsides, Seal Harbor, July 27, 1887, *John H. Redfield* (16); July 27, 1885, *Redfield* (4).—Great Cranberry Isl., September 3, 1885, *J. H. Redfield* (4).  
 —Bar Harbor, July 26, 1888, *Faxon* (3).

WALDO Co.: Wet roadside, New Guinea, Islesboro, August 4, 1897, *F. Tracy Hubbard* (1).

KENNEBEC Co.: Augusta, July 1, 1885, *E. C. Smith* (4).

LINCOLN Co.: Monhegan Isl., 1902, *F. Grace Smith* (no. 78) (3).

## ORCHIDACEÆ

SAGADAHOC Co.: Georgetown, August 9, 1902, *Hollis Webster* (3).

CUMBERLAND Co.: Brunswick, 1862, *E. L. Sturtevant* (4).

*H. clavellata*

### NEW HAMPSHIRE

Base of White Mts., September, 1842, *A. Gray* (3).

COOS Co.: Dismal Pond near Glen House, August 15, 1855, *Wm. Boott* (3).

—Randolph, *Faxon* (3); July, 1889, *Clara E. Cummings* (4).—Peat bogs, common, Crawford House, August 14, 1895, *E. H. Eames* (2).

GRAFTON Co.: Pond, Cannon Mt., August 1, 1863, *Wm. Boott* (3).

BELKNAP Co.: Gilmanton, August 8, 1864, *J. Blake* (4).

CHESHIRE Co.: Woods, Jaffrey, July 17, 1898, *B. L. Robinson* (no. 476) (3); bog, August 11, 1890, *Walter Deane* (1, 2).

### VERMONT

CALEDONIA Co.: Head of Winooski River, Peacham, August 7, 1886, *F. Blanchard* (2).

CHITTENDEN Co.: Sphagnous swamp, Charlotte, July 29, 1879, *C. G. Pringle* (7).—Richmond, July 19, 1899, *Eggleston* (no. 1627) (2, 4).

ADDISON Co.: Cold peat bog near summit, Mt. Mansfield, July, 1896 (5).—Bristol Pond bog, July 30, 1877, September 27, 1878, *C. G. Pringle* (7).

RUTLAND Co.: Chittenden, August 18, 1895, *W. W. Eggleston* (5, 14).

### MASSACHUSETTS, ESSEX COUNTY

Andover, July 29, 1882, *C. W. Swan* (6).—Salisbury, July, 1903, *A. A. Eaton* (1).

MIDDLESEX Co.: Medford, August 15, 1858, *Wm. Boott* (3).

WORCESTER Co.: Lunenburg, August 18, 1884, *C. W. Swan* (6).—Rare, wet meadow bordering Lake Chaubunagungamaug, Webster, July 25, 1899, *E. A. Spalding* (17).

FRANKLIN Co.: Sunderland, September 3, 1874, *S. Watson* (3).—Shelburne, *Miss S. E. Anderson* (10).

HAMPSHIRE Co.: Southampton, 1892, Hb. Chapman (5).

NORFOLK Co.: Dedham, July, 1875, *E. H. Hitchings* (3).—Moist shady border of thicket, Stoughton, September 21, 1904, *R. G. Leavitt* (1).

PLYMOUTH Co.: Swamp near Quaker Leonard Road, Brockton, July 16, 1903, *A. A. Eaton* (1).

BRISTOL Co.: North Easton, July, 1899, *O. Ames* (1); July 31 and September 25, 1901, *R. G. Leavitt* (5).—Easton, August, 1897, *Carl Blomberg* (1).—Nonquit, August 30, 1888, *E. L. Sturtevant* (4).

## ORCHIDACEÆ

### *H. clavellata*

BARNSTABLE Co.: Hyannisport, August 29, 1888, *Walter Deane* (2).  
 DUKES Co.: Martha's Vineyard, August, 1888, *Carrie Harrison* (2).

### RHODE ISLAND, PROVIDENCE COUNTY

Swamps, Providence, August, 1844, *Geo. Thurber* (3).—Low field, Providence, July 31, 1892, *J. Franklin Collins* (2).

KENT Co.: Warwick, September 3, 1871, *J. W. Congdon* (4).

### CONNECTICUT, LITCHFIELD COUNTY

Wooded swamp, Woodbury, August 19, 1903, *E. B. Harger* (1).

HARTFORD Co.: Low ground, Southington, August 20, 1898, *L. Andrews* (no. 325) (3).

NEW HAVEN Co.: Oxford, August 23, 1879, *E. B. Harger* (no. 471) (2).  
 —Bradford, August 4, 1877, *Wm. Trelease* (4).

FAIRFIELD Co.: Rich woods, rather rare, Stratford, August 28, 1893, *E. H. Eames* (2).

### NEW YORK

*Dr. Torrey* (13).—Western New York, *A. Gray* (3).—Vaughns, July 8, 1897 (14).

WARREN Co.: Bear Pond on French Mt., July 25, 1892, *Stewart H. Burnham* (1).

GREENLAND

*Hartz*, July 11, 1889 (3). — Fox Havn in Arsuk Fjord, June 24, 1888, *Dr. L. Kolderup Rosenvinge* (6). — Julianehaab, 1899, *Rink* (3). — Pale pinkish yellow, sweet scented, rich damp soil brook banks, Godhavn, Disko I., August 4, 1878, *L. Krumlein* in Howgate Polar Expedition (3). — Boreal Disko, 1870, *Bryssen* (3). — Also from numerous localities in Europe. Distributed from Ural Siberia through northern Europe and mountains to Switzerland, England, Iceland, and Greenland. Probably in Arctic America.

I have been unable to discover a single authentic specimen of *Habenaria albida* from our range. If it occurs on the North American mainland it must be extremely rare and local. The labellum is variously trifid or 3-lobed, the middle lobe being longer and larger than the lateral ones.

*Habenaria flava* is represented by two forms, one of which is common in the northern United States. That these forms are

## ORCHIDACEÆ

specifically or even varietally distinct from one another is very *H. flava* doubtful. The specimens in the Linnæan and Gronovian herbaria are comparable to the specimens with elongated racemes frequently found in the South and Southwest. The specimen in Lindley's herbarium at Kew which represents *Platanthera herbiola* Lindl. is comparable to the form with congested racemes not uncommon in the New England states. The erect horn on the labellum of this species is very characteristic.

### NOVA SCOTIA, GUYSBOROUGH COUNTY

Low places along the river, Boylston, July, 1891, *Dr. Chas. A. Hamilton* (2, 3, 6).

### QUEBEC

By outlet of Lake Champlain, July 20, 1878, *C. G. Pringle* (7).

5. *H. integra* (*Nutt.*) *Spreng.*, *Syst. Veg.* 3: 689 (1826); *Torr.*, *H. integra* *Comp.* 317 (1826); *Beck*, *Bot. ed.* 1, 348 (1833); *Eaton & Wr.*, *N. A. Bot. ed.* 8, 260 (1840); *Gray*, in *Sill. Journ.* 38: 309 (1840); *Gray*, *Man. ed.* 5, 499 (1867), ed. 6, 506 (1889), *Field, For. & Gard. Bot.* 325 (1868), rev. ed., 407 (1895); *Willis*, *Cat. N. J.* 61 (1874); *Britton*, *Prel. Cat. N. J.* 94 (1881); *Gattinger*, *Tenn. Fl.* 83 (1887); *Britton*, *Cat. N. J.* 234 (1889); *Britton & Br.*, *Ill. Fl.* 1: 463, f. 1102 (1896); *Gattinger*, *Fl. Tenn.* 62 (1901); *Mohr*, *Pl. Life Ala.* 454 (1901); *Jelliffe*, *Gibson's Nat. Orch.* 35, 41, t. 16, f. 2 (1905). (Self-fertilized, see *Bull. Torr. Bot. Cl.* 20: 33.)

*Orchis integra* *Nutt.*, *Gen.* 2: 188 (1818); *Wood*, *Class-book ed.* 41, 533 (1856).—*O. flava* *Nutt.*, *Gen.* 2: 188 (1818), not *L.*; *Elliott*, *Sketch* 2: 485 (1824); *Torr.*, *Comp.* 317 (1826).—*O. crocea* *Raf.*, in *Atl. Journ.* 119 (1832).<sup>1</sup>

<sup>1</sup> There can be no doubt that Rafinesque's *Orchis crocea* is a synonym of this species, as the description fits it well, and as there is no other species with saffron-colored flowers and entire lip. His description is as follows:

*H. integra* *Habenaria Elliottii* Beck, Bot. ed. 1, 348 (1833), not Rolfe; Darby, Bot. S. St. 527 (1866).

*Gymnadenia flava* Lindl., Gen. & Sp. Orch. 279 (1835); Steud., Nomencl. ed. 2, 1: 712 (1841); Gray, Man. ed. 1, 469 (1848), ed. 2, 444 (1856); ed. 3, 444 (1859); Chapm., Fl. S. U. S. ed. 1, 459 (1860), ed. 2, 459 (1884), ed. 3, 485 (1897).

*Platanthera integra* Beck, Bot. ed. 2, 348 (1856).—*P. flava* Wood, Class-book, 683 (1861)<sup>1</sup> in part (?).

*Gymnadeniopsis integra* Rydb., in Britton's Man. 293 (1901); Small, Fl. Se. U. S. 316 (1903).

*Platanthera fuscescens* Kränzl., Orch. Gen. et Sp. 1: 943 (1901) in part, not *Orchis fuscescens* L. (*Perularia fuscescens* Lindl.) nor *Habenaria flava* Spreng.

"4. \**integra*. Lip oblong, entire, longer than the inner petals; spur longer than the germ, acute at the point; stem leafy, bractes shorter than the flowers. HAB. In the swamps of New Jersey. Nearly allied to *O. ciliaris* and with flowers of the same orange-yellow colour, but somewhat smaller.

"6. *flava*. Lip ovate, entire, partly crenulate; spur attenuated, filiform and about the length of the germ; spike crowded; bractes longer than the flowers. HAB. In New Jersey, Z. Collins. v. s. In herb. Collins and Muhlenberg. Flowers pale orange-yellow, rather small. Spur widening above." Nutt. *loc. cit.*

The Muhlenberg specimens, and also those cited by Elliott, are undoubtedly *H. integra*, as a specimen in Hb. Elliott sent to him by Muhlenberg is this species.

"*Orchis* (or *Habenaria*) *crocea* Raf. Stem angular, leaves lanceolate acuminate, spike short cylindrical, bracts lanceolate equal to flowers, spur slender equal to ovary, petals ovate acute, labellum nearly similar hardly longer, entire.

"Discovered and collected by D. W. Fisher. Very different from *O. ciliaris*, flowers smaller, saffron color, not ciliated. Slender plant 15 inches high. Probably an *Habenaria*." (A. A. E.)

<sup>1</sup> Wood cites *O. flava* and *O. nigra* Nutt. as synonyms. Doubtless *nigra* is a misprint for *integra*. (A. A. E.)

## ORCHIDACEÆ

### NEW JERSEY

*H. integra*

*Muhlenberg* (13).—1864, *Wm. M. Canby* (3).—*Austin* (5).—Pine barrens, *D. C. Eaton* (6).

BURLINGTON Co.: Low pine barrens, Atsion, September, 1862, *Wm. M. Canby* (16).—Quaker Bridge, 1833 (3) (*Habenaria Elliottii* Beck).—Swamps, August 26, 1863, *C. F. Parker* (7); August, 1866, *Parker* (4); September 3, 1867, *Parker* (3).

New Orleans, *Drummond* (3, 19).—Prairies, Lake Charles, September, 1906, *R. S. Cocks* (no. 3125) (3).

### TEXAS

*Drummond* (no. 406) (3).

ORCHIDACEÆ

*H. integra* TENNESSEE

*Met Curtis* (4).

SUMNER Co.: Mitchellville, September, 1883, *Dr. A. Gattinger* (8).

DAVIDSON Co.: Nashville, *Gattinger* (16).

COFFEE Co.: Tullahoma, August, 1867, *Gattinger* (2, 8).

*H. nivea* , **6. *Habenaria nivea* (Nutt.) Spreng.**, Syst. Veg. 3: 689 (1826); *Gray*, Man. ed. 6, 507 (1890), Field, For. & Gard. Bot. 325 (1868), rev. ed. 407 (1895); *Hall*, Pl. Tex. 23 (1873); *Britton & Br.*, Ill. Fl. 1: 462, f. 1099 (1896); *Harper*, in Bull. Torr. Bot. Cl. 27: 423, 424 (1900); *Mohr*, Pl. Life Ala. 454 (1901); *Jelliffe*, Gibson's Nat. Orch. 34, t. 16, f. 1 & 3 (1905). (Self-fertilized Bull. Torr. Bot. Cl. 20: 33.)

*Orchis nivea* Nutt., Gen. 2: 188 (1818); *Elliott*, Sketch 2: 485 (1824); *Eaton & Wr.*, N. A. Bot. ed. 8, 334 (1840).

*Gymnadenia conica* Lindl., Gen. & Sp. Orch. 280 (1835); *Steud.*, Nomencl. ed. 2, 1: 711 (1841); *Correvoon*, Orch. Rust. 90 (1893).—*G. nivea* Lindl., Gen. & Sp. Orch. 280 (1835) (not *G. orchidis*, as suggested in Index Kewensis); *Steud.*, Nomencl. ed. 2, 1: 712 (1841); *Engelm. & Gray*, in Bost. Journ. Nat. Hist. 5: 236 (1845); *Chapm.*, Fl. S. U. S. ed. 1, 459 (1860), ed. 2, 459 (1884), ed. 3, 485 (1897); *Wood*, Class-book, 682 (1861); *Correvoon*, Orch. Rust. 93 (1893).

*Peristylus niveus* Kränzl., Orch. Gen. et Sp. 1: 520 (1898), 926 (1901).

*Gymnadeniopsis nivea* Rydb., in Britton's Man. 293 (1901); *Small*, Fl. Se. U. S. 316 (1903); *Bayard Long*, in Torreya 8: 16 (1908).

“5. \**nivea*. Lip linear-oblong, entire, longer than the inner petals; spur filiform, equal, longer than the germ; segments of the corolla spreading; spike short and oblong; lower leaves linear and very long, cauline subulate. HAB. Betwixt St. Mary's

## ORCHIDACEÆ

and Satilla river, West Florida.—Dr. Baldwyn, who favoured *H. nivea* me with a specimen under the above name. Flowers clear white, rather small. Lower leaves narrow, a span long, upper ones disproportionately small; bractes shorter than the germ. Genitaliferous column remarkably small in proportion, not half so large as the preceding,<sup>1</sup> the pollinia are consequently sessile. Spike rather dense, 2 or 3 inches long.” Nutt. *loc. cit.*

*Gymnadenia conica* as represented in Lindley’s herbarium at Kew is conspecific with *Habenaria nivea*. Lindley’s tracing from a flower of the plant collected in Florida by Cozzens clearly represents *H. nivea*.

### DELAWARE, KENT COUNTY

Savannas near Felton, August 30, 1867, *Wm. M. Canby* (3, 4, 5, 6, 16).

(1902); *Haberer*, in *Rho.* 7: 106 (1905); *House*, in *Bull. Torr.*  
*Bot. Cl.* 32: 377 (1905).

This variety is distinguished from the species by its greenish-  
yellow flowers. From *H. hyperborea*, with which it is likely to  
be confused, it is distinguished by the rhombic base of the la-  
bellum. It is found together with the species. No attempt has  
been made to distinguish between the white and greenish flow-  
ered forms in the following citations of specimens.

*Habenaria dilatata* is an extremely variable species both in  
its vegetative and floral parts, consequently agreement as to  
what forms it should include is hardly to be expected. In my  
studies I have examined material both dry and fresh, both wild  
and cultivated, and I have found no satisfactory characters by  
which to separate from one another and from *H. dilatata* the  
segregates which have been recognized by botanists. The origi-  
nal or type specimen of *H. dilatata* preserved in the British Mu-  
seum of Natural History, although badly damaged, is quite ser-  
viceable and exhibits a boreal state which differs from the lux-  
uriant specimens common in more southern localities in nothing  
but its vegetative parts. The habit of the type is well repre-  
sented by specimens collected in the Province of Quebec in al-  
pine bogs on Mt. Albert by Collins and Fernald. Such forms

## ORCHIDACEÆ

as are represented by *Habenaria fragrans*, *H. borealis* var. *albiflora*, and *Platanthera graminea* are merely vegetative variants and are scarcely worthy of even varietal distinction. It is a question whether or not plants referable to these maintain during several generations the characteristics which have been regarded specifically valid. It is by no means improbable that the boreal form if transplanted to less rigorous conditions would assume a more luxuriant and taller habit.

Dr. Rydberg has reinstated *Habenaria borealis* var. *albiflora* Cham. in his genus *Limnorchis*, and asserts that it differs from *Habenaria dilatata* in its shorter, more clavate spurs, dull or greenish white flowers, and in the usually smaller size. According to his views *H. borealis* represents *H. dilatata* in the Rocky Mountain region. In addition to specimens collected in the Northwest by Chamisso, distributed as *H. borealis* var. *viridiflora* and *H. borealis* var. *albiflora*, I have examined both dried and fresh material from British Columbia which is well within the range to which Dr. Rydberg assigns *H. borealis*. In 1904 I received material from Mr. E. Wilson, gathered in British Columbia, which grew very well in the wild garden connected with my laboratory. Near at hand, in the same garden, were numerous specimens specially collected in Vermont and Maine for comparison with the Northwestern specimens. A careful study of the different sets of plants showed no appreciable difference in the color of the flowers, length of spurs, denseness of the inflorescence, characters of the foliage or outline of the lips. Every peculiarity exhibited by the plants from the Northwest was found in plants from Vermont and Maine.

There were two colonies of the British Columbian plants, one in a shaded locality, the other in an open grassy place, where during the morning the plants received the full brightness of the

## ORCHIDACEÆ

*H. dilatata* sun. A similar distribution of the Eastern specimens was arranged. The results of this experiment tend to show that Dr. Rydberg's conclusions are by no means convincing, and that the differences on which he relies in making distinctions between the Eastern and Northwestern plants are very often individual peculiarities of trifling importance. The variation in the conformation of the lips in all of the colonies was remarkable and showed every gradation from rhombic-lanceolate to linear. The spurs, too, both in length and stoutness, exhibited no constancy even on the same plant.

The position of the variety *leucostachys* is not so clear as that of *H. borealis*. It is evident, however, that the length of the spur is the only conspicuous character which may be relied on for its identification. Among specimens from Little Metis, Province of Quebec, collected in August, 1902, by E. C. Jeffrey, there are flowers, with elongated slender spurs, which resemble so closely specimens from California, collected by E. B. Copeland, that it is impossible to differentiate between them without reference to the labels. The Californian specimens would without hesitancy be referred to *H. leucostachys*, while the Canadian plants would be referred to *H. dilatata* because of their Eastern origin. On the other hand between these long-spurred specimens and the typical form of *H. dilatata* there are transitions which tend to show that specific distinction is out of the question. Perhaps *H. leucostachys* should, after all, be referred to the synonymy of *H. dilatata*. In 1899 I collected near Mt. Shasta, California, a series of specimens which represents both long and short-spurred forms. The short-spurred specimens if found in the eastern United States would be referred without hesitation to *H. dilatata*.

*Limnorchis fragrans* Rydberg is, as its name implies, partly

## ORCHIDACEÆ

distinguished by fragrant flowers. Fragrance is not uncommon *H. dilatata* in *Habenaria dilatata*. It has been detected frequently enough to be regarded an attribute of the species. I have detected it in all the material I have collected, and in the plants from Mt. Albert, Quebec, which resemble the type, fragrance was noted by Collins and Fernald.

*Platanthera graminea* Lindl., which Rydberg reinstated in his genus *Limnorchis*, under the specific name *graminifolia*, was described originally by Lindley from Western specimens collected by Menzies. I examined Lindley's type with extreme care in 1905, and compared it with a rich series of *dilatata* forms from my herbarium. The results of my examination absolutely convince me that *P. graminea* is nothing more than a slender, narrow-leaved condition of *Habenaria dilatata*.

In *Orchidacearum Genera et Species* Dr. Kränzlin reduces *Habenaria dilatata* to a variety of *H. hyperborea*. This treatment of the subject, while it may appear very radical to American botanists, is more comprehensible than the course which Rydberg has pursued in his monograph of the genus *Limnorchis*. These two authors stand at the extremes in their views of the systematic arrangement of the *Dolichostachyæ*. Kränzlin reduces species because he finds it a fruitless task to try to differentiate them; Rydberg multiplies species, using characters which Kränzlin finds inconstant. In my opinion both of these writers have gone too far, yet, notwithstanding an extended study of numerous specimens, many of them constituting the types of the species examined, I feel that finality is hardly to be expected where the *Dolichostachyæ* group is concerned until material from numerous localities has been observed under cultivation, or at least while fresh and equally developed. Stoutness and thinness of spur, comparative length of spurs and lips,

## ORCHIDACEÆ

*H. dilatata* and similar distinctions, are too much influenced by the age of the flowers examined to be seriously considered in the differentiation of plants supposed to be distinct.

When one studies the work of European botanists devoted to our orchid flora, the fact must not be overlooked that they often had to draw conclusions from inadequate material and were unable to ascertain the range of variation or the extent and effects of distribution.

<sup>1</sup>This is the plant to which, under the name *H. flagellaris*, Kränzlin refers in *Orch. Gen. et Sp.* It would seem that the “n” in “*flagellans*” became “ri” in his manuscript. Rydberg states (*Bull. Torr. Bot. Cl.* 28: 612) that *H. flagellaris* was never published, but he does not refer to *H. flagellans* in his monograph and was probably misled by Kränzlin’s error.

Boggy places, Donald, Columbia Valley, July 4, 1885, *Macoun* (6); swamps, July 13, 1885, *Macoun* (3).

VICTORIA Co.: Beacon Hill, June 12, 1893, *Macoun* (3, 6).

WASHINGTON

Yakima Region, 1882, *T. S. Brandege* (no. 480) (4).—Cascade Mts. 49° N. lat., 1859, *Lyall* (3).—1889, *G. R. Vasey* (no. 77) (2, 3).—1880, *J. M. Grant* (no. 11) (9); 1884, *Grant* (2).—Moist ravines, marshes, 5100 ft., head of Poison Creek, September 1, 1897, *M. W. Gorman* (no. 812) (2).—Nason City, July, 1893, alt. 2000–3000 ft., *J. H. Sandberg* & *J. B. Leiber* (2).—Kuskuskie River, Capt. Wilkes' Exp. (no. 256) (2).—Open, wet ground, upper valley of the Nesqually, July 10, 1894, *O. D. Allen* (no. 75) (2, 3, 4, 5, 6, 7).

CLALLAM Co.: Olympic Mts., August, 1900, *A. D. E. Elmer* (no. 2551) (2, 4).

SPOKANE Co.: Mt. Carleton, July 17, 1902, *Frank O. Kreager* (no. 195) (3).

KITTITAS Co.: Slopes of Mt. Stuart, alt. 545 m., July 24, 1893, *Sandberg* & *Leiber* (no. 576) (2).

<sup>1</sup>Lindley's type of *Platanthera leucostachys*, collected by Douglas in 1826, is accompanied by a drawing which represents *retuse* petals. This peculiarity is not characteristic of the flowers of the type.

## ORCHIDACEÆ

- H. dilatata* KING Co.: Seattle, June 25, 1890, *E. C. Smith* (4). — Snoqualmie, June 4, 1889, *Smith* (no. 291) (3, 4).  
 var. *leucostachys* THURSTON Co.: Near Olympia, alt. 500 ft., July 14, 1898, *A. A. & E. G. Heller* (no. 4046) (2, 3, 4, 5, 14).  
 KLICKITAT Co.: On wet meadows, Falcon Valley, June 25, 1893, *W. N. Suksdorf* (no. 1356) (1, 2, 3, 4).  
 WALLAWALLA Co.: Waitsburg, June 4, 1897, *R. M. Horner* (no. 466) (2).  
 COLUMBIA Co.: Near springs, Blue Mts., August 10, 1897, *Horner* (no. 467) (2, 3).

### OREGON

- Cascades, July, 1893, *Mrs. R. M. Austin* (no. 240) (9). — In marshes, June, 1880, *Thos. J. Howell* (2, 4, 16). — 1871, *Elihu Hall* (no. 505) (3, 4, 16). — 1897, *Edmund P. Sheldon* (nos. 8660, 8261) (2).  
 CLACKAMAS Co.: Milwaukee, August 9, 1903, *Howell* (1).  
 WASCO Co.: Paulina Lake, alt. 2100 m., July 23, 1894 (no. 553) (2). — Wet places, Hood River, June 4, 1883, *Joseph Howell* (6).  
 KLAMATH Co.: Swan Lake Valley, August, 1894, *Elmer I. Applegate* (no. 692) (3).  
 LAKE Co.: Warner Range, alt. 1900 m., June 25, 1896, *Coville & Leiberg* (no. 30) (2). — Side of Mt. Scott, swamp exposed to sky, alt. 3500 ft., July 21, 1899, *M. A. Barber* (3).

### IDAHO

- Soldier Mts., alt. 8000 ft., July 16, 1895, *L. F. Henderson* (no. 3348) (2). — Near Reader Creek, alt. 900 m., July 24, 1897, *John B. Leiberg* (no. 2747) (2). — Wet places in the mountains, July, 1892, *A. Isabel Mulford*, (3, 4). — Wet land, shade, May 21, *Rev. Mr. Spalding* (4).  
 LATAH Co.: Marshes in woods, Craig and Moscow Mts., June 23, 1894, *Henderson* (2, 5, 14).  
 NEZ PERCÉS Co.: On the lower Clearwater River, June 2, 1892, *Sandberg, MacDougal & Heller* (no. 288) (2, 3). — Clearwater, *Rev. Mr. Spalding* (3, 9). — Forest, 3500 ft., July 16, 1896, *A. A. & E. Gertrude Heller* (no. 3436) (2).

### CALIFORNIA

- Between Genter's and the Tuolumne River, 1872, *A. Gray* (3). — Shasta (= Trinity) Mts., 3000–4000 ft. alt., September 1860–2, *W. H. Brewer* (no. 1453 in part) (3). — 1875, *G. R. Vasey* (2). — Southern California, June, 1882, *D. Cleveland* (10). — *Thos. Bridges* (no. 356) (2, 3). — Deer Park, Lake

## ORCHIDACEÆ

- Tahoe, August, 1896, *Miss M. E. Parsons* (9).—Lake Tahoe, July, 1895, *Mr. Abraham* (9); July, 1898, *Mrs. Edward Probert* (9); *in uliginosis* var. *leucostachys* *prope L. Tahoe*, August 31, 1892, *John H. Redfield* (4).—Lincoln Valley, July 23, 1901, *P. B. Kennedy* & *S. B. Doten* (9).—Hetch-Hetchy Valley, June, 1900, *F. T. Bioletti* (9).—Sierra Nevada Mts., 1875, *Dr. A. Kellogg* (9).—School Station, May, 1869, *Kellogg* & *Harford* (no. 958) (2). SISKIYOU Co.: Wet mountain meadow, near camp on Mt. Shasta, August 22, 1880, *G. Engelmann* (4).—Near Shasta Springs, June, 1899, *O. Ames* (1).—In grass beside railroad track, Moss Brae Falls, June, 1899, *Ames* (1).—Foot of Mt. Eddy, 4000 ft., August 17, 1903, *E. B. Copeland* (no. 259) (1).—Sisson, alt. 3555 ft., June 1–10, 1897, *H. E. Brown* (no. 320) (2, 3, 4, 5, 9).—Mt. Shasta and vicinity, July 13–27, 1892, *Dr. Edward Palmer* (no. 2568) (2, 5).
- MODOC Co.: Sugar-Loaf Hill Swamp, August, 1885, *Mrs. R. M. Austin* (9).
- SHASTA Co.: Mountains about head-waters of the Sacramento River, 6500 ft., August 31, 1881, *C. G. Pringle* (7).
- TRINITY Co.: Cañon Creek, July 2–18, 1901, *Alice Eastwood* (9).
- PLUMAS Co.: Indian Valley, *J. G. Lemmon* (3) (type of *H. flagellans* Wats.).—*Mrs. Austin* (5); 1877, *Mrs. Austin* (3, 5, 6); 1880, *Mrs. Austin* (2, 16).—Prattville, July, 1902, *Mrs. A. L. Coombes* (9).—Butterfly Valley, August, 1896, *Mrs. Austin* (no. 540) (4).
- MENDOCINO Co.: 1876, *Vasey* (3).—Oak Hills near Ukiah Valley, June 10 (1).—Swamp, August 6, 1902, *J. W. Congdon* (2).
- BUTTE Co.: Butte Creek, July, 1896, *Mrs. C. C. Bruce* (2, 4); July, 1896, *Mrs. Austin* (no. 6) (4).—Colby Ranch, Butte Creek, August, 1902, *Bruce* (9).
- SIERRA Co.: 1874, *J. G. Lemmon* (3, 16).
- NEVADA Co.: Lower end of Donner Lake, July 13, 1903, *A. A. Heller* (no. 6919) (1, 2, 3, 4, 9).
- LAKE Co.: Drew's Creek, *Mrs. Austin* (no. 243) (9).—Susanville, four miles below Eagle Lake, alt. 5000 ft., June 30, 1897, *M. E. Jones* (2, 4).—In the "Horse Pasture" near the summit of Mt. Sanhedrin, July 20, 1902, *Heller* (no. 5999 in part) (1, 2, 3, 4, 9).
- PLACER Co.: Summit Soda Springs, June 12, 1898, *Eastwood* (9).—Cisco, June 21, 1870, *Dr. Kellogg* (9).
- ELDORADO Co.: Tallac, July 8, 1897, alt. 6200 ft., *Ezra Brainerd* (5).—"Meadows," near Meisner's Sheep-ranch, July 17, 1897, alt. 7600 ft.,

ORCHIDACEÆ

*H. dilatata*  
var. *leucostachys*

*Brainerd* (7).—Tallac, Lake Tahoe, alt. 6280 ft., *Dr. F. C. Blaisdell* (no. 81) (9).—Slippery Ford, summer, 1903, *Mrs. F. M. Meigs* (9).—Fallen Leaf Lake, June 28, 1900, *Wm. W. Price* (9).

AMADOR Co.: Pioneer, July 13, 1896, alt. 3500 ft., *Geo. Hansen* (no. 1850) (2, 4, 9).—Tiger Creek, 4000 ft., July, 1892, *Hansen* (no. 1257) (4).

MARIN Co.: Sausalito Ravine, May 5, 1870, *Kellogg & Brannan* (9); woodless ravines, May 23, 1868, *Kellogg* (9).

TUOLUMNE Co.: Lord's Ranch, 5300 ft., July 7, 1888 (9).

SAN FRANCISCO Co.: Visitacion Valley, June 1, 1901, *Miss E. Cannon* (9).—Swamps near San Francisco, 1860–2, *Bolander* (3).

MARIPOSA Co.: Hopkin's Creek, above Yosemite, 1873, *Lemmon* (3).—Yosemite Valley, June 1860–2, *Brewer* (no. 1671) (3); July, 1866, *Bolander* (no. 4936) (4, 9, 16).—Mariposa Grove, July 30, 1893, *Eastwood* (9).

MONO Co.: Mammoth, July 22, 1891, *Coville & Funston* (no. 1822) (2, 3).

FRESNO Co.: October, 1890, *Mrs. Rawson Peckinpah* (2).—King's River, 1876, *Dr. G. Eisen* (9).—Sequoia Mills, Millwood, July 18, 1893, *Eastwood* (9); July 16, 1892, *T. S. Brandegee* (9); July 19, 1892, *Brandegee* (9).—Pine Ridge, 5000 ft., June 15–25, 1900, *Hall & Chandler* (no. 150) (4, 2, 9).—Fresno, 1902, *Chas. E. Jenney* (no. 115) (9).

INYO Co.: Mono Lake, July, 1860–2, *Brewer* (no. 1834) (3).—Borders of Oak Creek, Camp Independence, 5000 ft., 1877, *Dr. M. Matthews* (4).—Onion Valley, June 30, 1899, *S. W. Austin* (no. 254) (9).

MONTEREY Co.: Point Sur, July, 1888, *Brandegee* (9).

TULARE Co.: Halstead Meadows, Sequoia Park, alt. 2150 m., August 8, 1891, *T. S. Palmer* (no. 2096) (2).—Kaweah River Valley, July 28, 1891, *Coville & Funston* (no. 1335) (2); south fork of Kaweah River, 4500 ft., July 21, 1904, *Culbertson* (no. 4245) (1).—Kern River, near lakes, July 16, 1903, *Eastwood* (9).—Mineral King, July 13, 1903, *Eastwood* (9).—Grassy swamps, 8000–9000 ft., July 14, 1888, *Dr. E. Palmer* (no. 223) (2).

SAN BERNARDINO Co.: San Bernardino, *W. G. Wright* (no. 802) (9).—Bluff Lake, San Bernardino Mts., *Miss Pettibone* (no. 41) (15).—Bear Valley, San Bernardino Mts., August, 1882, *S. B. & W. F. Parish* (no. 1521) (3, 4, 8).—Edgar Cañon, San Bernardino Mts., alt. 3000 ft., June 13, 1894, *S. B. Parish* (no. 3134) (2, 4, 9).

SAN DIEGO Co.: Along creeks at 8000 ft., San Jacinto Mt., July 22, 1897,

“33. ORCHIS bulbis fasciculatis, nectarii cornu longitudine germinis: labio lineari integerrimo truncato. *König*.

“*Habitat in Islandia. König.*

“*Caulis palmaris cum spica. Folia alterna, lanceolata, longitudine caulis. Spica ovata: Bracteis lineari-lanceolatis, longitudine florum. Corollæ viridi-lutescentes: Petalum supremum latius, ovatum; Lateralia 2 superiora lanceolata, ad primum conniventia; Lateralia 2 inferiora oblonga. Labium vix petalo longius.*”  
*L. Mant. loc. cit.*

I have been obliged, as in my treatment of *H. dilatata*, to reduce several of Dr. Rydberg's species, as they are founded rather on geographic and inconstant distinctions than on real differences.

In *Habenaria hyperborea* we have, from every viewpoint, a perplexing species which presents many problems. The most difficult point to settle is the amount of variation we are to allow

## ORCHIDACEÆ

in a species so clearly polymorphic. Many careful observers have expressed the opinion that *H. hyperborea* is excessively variable, and that it includes not only the form which is represented by the Linnæan type, but the variants which some botanists have regarded as specifically distinct. *H. hyperborea*

The plant in the Linnæan herbarium is a boreal form of unusual aspect. Dr. Rydberg is inclined to regard it as separable from the plant which has been found so common in the northeastern part of the United States and Canada, and which has been identified as *Habenaria hyperborea* by the majority of American botanists. On the other hand Dr. Kränzlin is emphatic in his views expressed in his *Orchidacearum Genera et Species*, where he makes the synonymy of *H. hyperborea* a repository for the species which are regarded as distinct in most American botanical works. He has been Draconian in his treatment of the species allied to *H. hyperborea*, and of these he has considered as variants several which appear to have no close relationship with that species. The contrast between the views of Kränzlin and Rydberg is so radical that it induces caution in accepting their opinions. They view from diametrically opposite standpoints the phenomena of variation and polymorphism, and consequently they both pass to extremes which are significant and at the same time instructive.

In my studies of *Habenaria hyperborea* I have examined numerous specimens both fresh and dried, and aside from observations made in the field I have kept many plants under cultivation, where I could examine them throughout their growing season. I am convinced that it is futile to multiply the number of our species by paying close attention to minor traits, such as relative length of spurs and lips and comparative thickness of spurs. When I examined the specimen preserved in the Linnæan herbarium I was unable to discover any constancy in the

## ORCHIDACEÆ

*H. hyperborea* form of the spurs in accordance with Dr. Rydberg's descriptions. Aside from its dwarfness there is no character which separates the Linnæan plant satisfactorily from the slender *H. hyperborea* of northeastern America.

I cannot agree with Kränzlin's treatment of the species which constitute the *Hyperborea* group, because I find constant conspicuous differentiating characters for *H. sparsiflora*, *H. saccata*, *H. dilatata*, and *H. brevifolia*,—species which he refers to the synonymy of *H. hyperborea*.

It is quite true that all of these species are closely allied to one another, but extreme forms of any one of them appear to be conspicuously distinct. In this group no satisfactory work can be done which is not based on rich series of specimens taken throughout the range.

*H. hyperborea* var. *purpurascens*

*H. hyperborea* var. *purpurascens* (*Rydb.*) comb. nov.

*Limnorchis purpurascens* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 269 & 615 (1901).

“A rather stout plant, 3–5 dm. high, with fleshy-fibrous roots. Leaves ovate to lanceolate, acute, 6–10 cm. long, 1.5–3 cm. wide, dark green: bracts lanceolate, the lower exceeding the flowers: spike rather dense: flowers 10–12 mm. long: lateral sepals green, oblong-linear, or linear, obtuse, 4–5 mm. long; the upper sepal tinged with purple, broadly ovate, erect, obtuse: petals slightly shorter, erect, purple, lanceolate, oblique: lip broadly linear-lanceolate, about 5 mm. long, purplish, scarcely at all dilated at the base, the edges almost straight: spur scarcely more than half as long as the lip, much thickened and saccate.

“This species belongs to the *L. hyperborea* group, and is perhaps nearest related to that species. It differs, however, in the purple petals and lip and the shorter and more saccate spur. The spur has almost the same form as that of *L. stricta*; but from that species it differs in the dense spike and the broader lip. *L. purpurascens* grows in damp woods at an altitude of 2700–3000 m.

“COLORADO: Iron Mountain, 1900, *Rydberg & Vreeland*, 6414 (type); Manitou, 1900, *Fred Clements*, 172; Georgetown, 1878, *M. E. Jones*, 314.” *Rydb. loc. cit.*

## ORCHIDACEÆ

This plant when well developed can be distinguished readily by its very saccate spur, but it passes so gradually into the typical form of *H. hyperborea* that it is not worthy of more than varietal rank. Dr. Rydberg describes the flowers as purplish. It is to be regretted that this indefinite term has been used to characterize the flowers of a species of the *H. hyperborea* group. *H. hyperborea* var. *purpurascens*

### 9. *H. behringiana* (*Rydb.*) comb. nov.

*H. behringiana*

*Limnorchis behringiana* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 620 (1901).

“Stem low, 1–1.5 dm. high, about 3-leaved: tubers elongated fusiform, about 5 mm. thick: lower leaf ovate-lanceolate, about 5 cm. long and 1.5–2 cm. wide; the upper lanceolate and smaller: spike dense, 3–4 cm. long; bracts linear-lanceolate, the lower about twice as long as the flowers: flowers purplish, about 12 mm. long: upper sepal ovate, obtuse, 4–5 mm. long; the lateral ones

ORCHIDACEÆ

*H. behringiana* oblong: petals equalling the sepals, broadly lanceolate; lip about 5 mm. long; spur fully 10 mm. long, filiform. (Fig. 9.)

“Asia: Behring Island, 1891, *British Behring Sea Commission*, 143 (type in herb. Columbia Univ.)” Rydb. *loc. cit.*

This is not closely related to any other American species. The type specimens were labelled *Habenaria gracilis* Wats., with which species it has little in common.

Dr. Rydberg describes the flowers as purplish. I think that he must be in error regarding this detail. From dried specimens—the only ones which I have seen—the flowers appear to have been greenish.

ASIA, BERING ISLAND

July, 1891, *Grebnitzky* (6); August, 1891, *Grebnitzky* (no. 143) (4).

NORTH AMERICA, ATTU ISLAND (?)<sup>1</sup>

August 29, 1891, *J. M. Macoun* (no. 221) (3, 6); August 28, 1891, *Macoun* (7).

*H. saccata* 10. *H. saccata* *Greene*, in *Erythea* 3: 49 (1895).

*Platanthera gracilis* *Lindl.*, *Gen. & Sp. Orch.* 288 (1835); *Hook.*, *Fl. Bor. Am.* 2: 198 (1839); *Steud.*, *Nomencl. ed. 2, 2:* 351 (1841); *Kränzl.*, *Orch. Gen. et Sp.* 1: 639 (1899); *Piper & Beattie*, *Fl. Palouse* 49 (1901).—*P. stricta* *Lindl.*, *Gen. & Sp. Orch.* 288 (1835); *Hook.*, *Fl. Bor. Am.* 2: 199 (1839); *Steud.*, *Nomencl. ed. 2, 2:* 352 (1841); *Kurtz*, in *Engl. Bot. Jahrb.* 19: 408 (1895); *Piper*, *Fl. Mt. *Habenaria gracilis* *Wats.*, in *Proc. Am. Acad.* 12: 277

<sup>1</sup>The specimens in hb. 6 are not uniform. On the upper half of the sheet are three plants of *H. behringiana* which, in a note, J. Macoun has attributed to Grebnitzky, who collected them on Bering Island. On the lower half of the sheet are two specimens of *H. viridis* var. *bracteata*. The label which originally accompanied these five specimens tells that they were found in boggy spots, Attu Island, by J. M. Macoun in August, 1891. As Macoun's note refers directly to the specimens of *H. behringiana* it is impossible to state definitively that they came from North America. Presumably the specimens of *H. viridis* var. *bracteata* were collected on Attu Island.

Pl. 60

HABENARIA *behringiana* (Rydb.)

ORCHIDACEÆ

PLATE 60. *Habenaria behringiana*

Plants, natural size, reproduced from the specimens collected by Grebnitzky (I) on Bering Island, and by Macoun (II)? on Attu Island.

1. Flower, enlarged. 2. Petal, enlarged.

ORCHIDACEÆ

*H. saccata* (1877), Bot. Cal. 2: 135 (1880); *Macoun*, Cat. 4: 15 (1888); *Grace E. Cooley*, in Bull. Torr. Bot. Cl. 19: 245 (1892); *Rattan*, Fl. 177 (1898); *Howell*, Fl. Nw. Amer. 628 (1902), not *H. gracilis* Colebr., in Hook., Exot. Fl. 2, pl. 135 (1825), nor Lindl., Gen. & Sp. Orch. 312 (1835), nor Reichb. f., in Flora 48: 180 (1865).—*H. dilatatiformis* *Rydb.*, in Bull. Torr. Bot. Cl. 24: 189 (1897) in part.—*H. stricta* *Rydb.*, in Bull. Torr. Bot. Cl. 24: 189 (1897), not *H. stricta* Rich. & Gal., in Ann. Sci. Nat. ser. 3, 3: 29 (1845), nor Ridley, in Journ. Linn. Soc. 21: 510 (1885).

*Limnorchis stricta* *Rydb.*, in Mem. N. Y. Bot. Gard. 1: 105 (1900), in Bull. Torr. Bot. Cl. 28: 614 (1901), excl. syn. *Habenaria hyperborea*; *Piper*, Fl. Wash. in Contr. Nat. Herb. 11: 210 (1906).—*L. brachypetala* *Rydb.*, in Bull. N. Y. Bot. Gard. 2: 161 (1901), in Bull. Torr. Bot. Cl. 28: 616 (1901) as to type (*Williams*, Bennett City).—*L. gracilis* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 627 (1901), excl. spec. cit. *Onion*.—*L. laxiflora* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 630 (1901) as to specimens *Wilkes* & *Hall*; *Piper*, Fl. Wash. in Contr. Nat. Herb. 11: 210 (1906).

“Two feet high or more, slender, rather conspicuously leafy up to the lax and not long, bracted raceme of green flowers: base of the stem with a single quite ample subscarious sheath: leaves lanceolate, acute, 3 or 4 inches long, spreading; bracts of the raceme linear-lanceolate, surpassing the flowers: lateral sepals oblong-lanceolate, the upper ovate-oblong and shorter: lateral petals falcate; lip linear, much longer than the short and thick sac-like spur: capsule sessile.” *Greene, loc. cit.*

*Platanthera gracilis* Lindl. “*P. caule folioso, foliis linearibus acuminatis obtusis debilibus patentibus, spicâ laxâ elongatâ floribus inferioribus remotis, bracteis angustis acuminatis floribus longioribus, petalis obliquis acuminatis obtusis, labello lineari obtuso calcaris apice inflati obtusissimi longitudine.*”

## ORCHIDACEÆ

“Hab. in ora occidentali Americæ septentrionalis, Menzies; *H. saccata* Observatory inlet. *Herb. Hooker.* (hab. s. sp. comm. ccl. Menzies.)

“Caules debilis, 1½-2-pedales. Folia 3-poll. longa, parùm acuminata, nullo modo acuta.” Lindl. *loc. cit.*

I have studied Lindley's type specimens of *Platanthera gracilis* and *P. stricta* in conjunction with numerous specimens, selected for comparison, from my own herbarium. *P. gracilis* is a slender plant with linear, obtuse or acute leaves. *P. stricta*, on the other hand, is a stout plant with rather broad leaves; ovate-lanceolate according to Lindley's description. I have found that the only characters which Lindley employed to separate these species are inconstant, and consequently negligible. Aside from these characters used by Lindley there are no others that I have been able to discover which may be used to separate *P. gracilis* from *P. stricta*. (PLATE 61.)

### CALIFORNIA, MODOC COUNTY

Hills, in wet places, July, 1884, *Mrs. R. M. Austin* (9).—Swamps, Sugar Loaf Hill, August, 1885, *Mrs. Austin* (9).—Head-waters of Davis Creek, July, 1885, *Oliver Austin* (9).

### 11. *H. Richardii* nom. nov.

*H. Richardii*

*Platanthera longifolia* *Rich. & Gal.*, in *Ann. Sci. Nat.* ser. 3, 3: 30 (1845), not *Habenaria longifolia* Lindl., *Gen. & Sp. Orch.* 324 (1835).

“107. *P. longifolia* Nob. Fol. lanceolatis angustis; flor. viridibus: labello lineari, calcare inflato.” *Rich. & Gal. loc. cit.*

The type specimen of *Platanthera longifolia* is very unsatisfactory. The lowermost leaf is about 14.5 cm. long, linear, acute. The uppermost leaf is about 9.5 cm. long. The flowers are very difficult to observe, and, unfortunately, few. Measurements of the floral segments are as follows: dorsal sepal 5 mm. long; lateral sepals 7 mm. long; petals 5 mm. long, acute. Measurements of the lip and spur can only be made from moistened material. (PLATE 62.)

### MEXICO, VERA CRUZ

Fl. verdâtre, Pic d'Orizaba 8000, January–October, 1840, *Galeotti* (type).<sup>1</sup>

<sup>1</sup> This collection remains unique to this day. At Paris there is a single individual 2.5 dm. high, without roots; and a good drawing by Richard. No species known to me approaches it closely, although the individual flowers resemble those of *H. sparsiflora*. (A. A. E.)

ORCHIDACEÆ

PLATE 62

I. *Habenaria Richardii*. 1. Flower. 2. Petal. 3. Column and base of labellum. (Reproduced from a photograph of the original drawing by Richard of *Platanthera longifolia* Rich. & Gal.)

II. *Habenaria nubigena*. 1. Flower. 2. Column and base of labellum. 3. Petal. 4. Pollen-mass. (Reproduced from a photograph of the original drawing by Richard.)

III. *Habenaria volcanica*. 1. Flower. 2. Pollen-mass. (Reproduced from a photograph of the original drawing by Richard of *Gymnadenia neottioides* Rich. & Gal.)

comb. nov.

HABENARIA *volcanica*  
Watson

ORCHIDACEÆ

12. *H. Ghiesbreghtiana* (*Rich. & Gal.*) *Hems.*, Biol. Cent. *H. Ghiesbreghtiana*  
*Am.* 3: 305 (1884).

*Platanthera Ghiesbreghtiana* *Rich. & Gal.*, in *Ann. Sci. Nat. ser. 3*, 3: 30 (1845); *Reichb. f.*, in *Linnæa* 28: 381 (1856).—

*P. hyperborea* VAR. *leucostachys* *Kränzl.*, *Orch. Gen. et Sp.* 1: 642 (1899), 943 (1901) in part.

“108. *P. Ghiesbreghtiana* Nob. Fol. lanceolatis acutis, flor. viridibus numerosis: labello lanceolato, crasso subacuto.” *Rich. & Gal. loc. cit.*

*Habenaria Ghiesbreghtiana* is closely allied to *H. brevifolia*, and may be inseparable from it, but the material I have examined has not been sufficient to warrant a definitive conclusion. The leaves of *H. Ghiesbreghtiana* are 8.5 cm. in length on the type specimen and somewhat spreading, thus differing from the leaves of *H. brevifolia* which are rarely 7 cm. long and conspicuously appressed to the stem. The specimen collected by Conzatti, cited above, was compared with Richard's type, and agreed with it in detail save as to leafage.

MEXICO, OAXACA

*Ghiesbreght* (type).<sup>1</sup>

? CERRO DE SAN FELIPE: *Conzatti & Gonzalez* (no. 457b).

13. *H. nubigena* (*Rich. & Gal.*) comb. nov.

*H. nubigena*

*Platanthera nubigena* *Rich. & Gal.*, in *Ann. Sci. Nat. ser. 3*, 3: 29 (1845).

“106. *P. nubigena* Nob. Parvula: fol. elliptico-oblongis; flor. albido-virescentibus: labello lineari obtuso.” *Rich. & Gal. loc. cit.*

The type of this, a Mexican species (*Galeotti* no. 5257), consists of a single individual 9 cm. tall, with lanceolate-triangular leaves,

<sup>1</sup>There is one individual of this at Paris and a drawing of a flower and bract, a lip and column and a pollen-mass. (A. A. E.)

ORCHIDACEÆ

*H. nubigena* about 3 flowers and several buds. In addition to this material there is a drawing of a flower, petal, column and lip-base, and pollinium. It appears to be distinct. The dorsal sepal is 5 mm. long, 3 mm. wide. The lateral sepals are 6 mm. long. The oblong, linear lip is 5 mm. long. (PLATE 62.)

*H. sparsiflora*

14. *H. sparsiflora* *Wats.*, in *Proc. Am. Acad.* 12: 276 (1877), *Bot. Cal.* 2: 134 (1880), not *Platanthera sparsiflora* *Schltr.*, in *Bull. Herb. Boiss.* 7: 538 (1899)?;<sup>1</sup> *S. B. & W. F. Parish*, *Pl. So. Cal.* 7; *Macoun*, *Cat.* 4: 15 (1888), excl. syn.; *Rattan*, *Fl.* 176 (1898).—*H. Thurberi* var. *Wats.*, *Bot. Cal.* 2: 134 (1880).

*Platanthera hyperborea*  $\delta$  *leucostachys* *Kränzl.*, *Orch. Gen. et Sp.* 1: 642 (1899).—*P. Thurberi* var. *Grayi* *Kränzl.*, *Orch. Gen. et Sp.* 1: 643 (1899) in syn.<sup>2</sup>

*Limnorchis ensifolia* *Rydb.*, in *Bull. Torr. Bot. Cl.* 28: 629 (1901).—*L. laxiflora* *Rydb.*, in *Bull. Torr. Bot. Cl.* 28: 630 (1901), excl. *Hall* (no. 504).—*L. sparsiflora* *Rydb.*, in *Bull. Torr. Bot. Cl.* 28: 631 (1901).

*Habenaria aggregata* *Howell*, *Fl. Nw. Amer.* 628 (1902).

“HABENARIA SPARSIFLORA. Stem rather slender, a foot or two high, leafy: leaves narrowly lanceolate, acutish or acute: bracts linear-lanceolate, acuminate, usually much exceeding the greenish flowers, which are few (10 to 20) and distant: perianth thin and delicate, apparently spreading: sepals 3-nerved, the lateral ones oblong or lanceolate, 2 or 3 lines long, the upper ovate and a little shorter: lip several-nerved, narrow, linear or lanceolate,

<sup>1</sup> That this species, heretofore not reported south of the United States, has been found in Guatemala is extremely doubtful. Probably Schlechter's identification was based on the closely related *H. volcanica*, which is common southward, or on *H. limosa*, which extends throughout Mexico.

<sup>2</sup> Kränzlin (*loc. cit.*) cites *P. Thurberi* var. *Grayi* *Wats.* There never was such a combination. Watson says that “*Habenaria Thurberi*, var., *Gray*, *Proc. Am. Acad.* vii. 389,” is *H. sparsiflora*.

## ORCHIDACEÆ

3 or 4 lines long, nearly equaling the narrow spur: anther emarginate; stalks of the pollen-masses very slender: glands orbicular: beak of stigma broadly triangular: capsule oblong, sessile, 6 lines long.—*H. Thurberi*, var., Gray, Proc. Am. Acad. vii. 389. Common in the Sierra Nevada and mountains of northern California; marked by its peculiar habit. The typical *H. Thurberi* is to be referred to *H. leucostachys*." Wats. *loc. cit.*

*Habenaria sparsiflora* is very closely allied to *H. saccata*. It differs from that species in its more slender spurs and larger flowers. Usually in *H. sparsiflora* the spur is subequal to the lip, and if short and stout is cylindrical rather than saccate or scrotiform.

*H. aggregata* surely belongs with *H. sparsiflora*. (PLATE 61.)

63

## ORCHIDACEÆ

Mexico, in open woods of *Pinus ponderosa*, in flower September 14, 1880. *H. brevifolia*

“A striking species, in floral character most like *H. sparsiflora*, Watson, which grows by shady streamlets in the same region, but of very different habit, being nearly leafless, the foliage reduced to mere loosely sheathing bracts, their tips only somewhat leafy-spreading, and the stout stems flowering from near the ground.” Greene, *loc. cit.*

### NEW MEXICO

In dry ground under *Pinus ponderosa*, Pinos Altos Mts., September 14, 1880, *Edward Lee Greene* (no. 369) (3, 4, 9, 16), (type).

LINCOLN Co.: White Mts., 7000 ft., August 17, 1897, *E. O. Wootton* (2, 4, 5).

### MEXICO, CHIHUAHUA

Damp soil, Sierra Madre, October, 1887, *C. G. Pringle* (no. 1374) (2, 3, 7, 16); Sierra Madre, near Colonia Garcia, 7500 ft., August 8, 1899, *C. H. Townsend & C. M. Barber* (no. 216) (2, 3, 4, 5); August 1–20, 1899, *E. W. Nelson* (no. 6201) (2).

MICHOACÁN: Mountains near Patzcuaro, October 12, 1892, *Pringle* (no. 5314) (3, 7).

FEDERAL DIST.: Eslava, Valley of Mexico, 8000 ft., September 7, 1901, *Pringle* (no. 9626) (3), a single specimen.

GUERRERO: Top of Sierra Madre near Chilpancingo, alt. 9000–10,200 ft., December 24, 1894, *Nelson* (no. 2194) (2).

OAXACA: Wet soil, Sierra San Felipe, 8500 ft., August 8, 1894, *Pringle* (no. 5758) (3); September 12, 1897, *C. Conzatti & V. Gonzales* (no. 458) (1).

16. *H. volcanica* (*Lindl.*) *Wats.*, in *Proc. Am. Acad.* 18: 159 (1883). — *H. vulcanica* (*Lindl.*) *Hems.*, *Biol. Cent. Am.* 3: 306 (1884).

*Platanthera volcanica* *Lindl.*, in *Ann. Nat. Hist.* 4: 381 (1840), in *Benth. Pl. Hartw.* 53 (March, 1840).

*Gymnadenia neottioides* *Rich. & Gal.*, in *Ann. Sci. Nat.*

ORCHIDACEÆ

*H. volcanica* ser. 3, 3: 30 (1845).—*G. prasina* A. Rich., in hb.—(Cf. *Platanthera sparsiflora* Schltr., in Bull. Herb. Boiss. 7: 539.)

“PLATANTERA (§ 1. a.) *volcanica*; caule folioso, foliis ensiformibus erectis trinerviis, spicâ elongatâ cylindraceâ, bracteis herbaceis acuminatissimis floribus longioribus, petalis ovatis sepalisque obtusis, labello lanceolato obtuso medio subcalloso calcare filiformi triplò brevior, antherâ subhorizontali, rostello plano 3-lobo.—*Mexico*: Real del Monte, in agro volcanico prope Guajolote, Oct. Hartweg.

“The stem of this plant is from 1 to 3 feet high, or even more. Its nearest affinity is with *P. leucostachya*. The sepals are herbaceous; the petals and lip purple.” Lindl. *loc. cit.*

Furthur studies on more material may prove that *Habenaria volcanica* and *H. limosa* are conspecific, in which case *H. limosa* should become the name of the species. The difference in the outline of the lip appears to be the only satisfactory means of separating *H. volcanica* from *H. limosa*. In the former the lip is lanceolate, in the latter oblong-linear. (PLATE 62.)

MEXICO, LOWER CALIFORNIA

La Chuparosa, October 17, 1893, *T. S. Brandege* (1, 3).

CHIHUAHUA: In the Sierra Madre, June 21–July 29, 1899, *E. W. Nelson* (no. 6151) (2); August 1–20, 1899, *Nelson* (no. 6197) (2).—Sierra Madre, near Colonia Garcia, 7500 ft., August 16, 1899, *C. H. Townsend* & *C. M. Barber* (no. 262) (4).

COAHUILA: Carneros Pass, Picacho Mts., September 15, 1889, *Pringle* (no. 2828) (3, 7).

ZACATECAS: In the Sierra Madre, August 18, 1897, *J. N. Rose* (no. 2386) (2).

FEDERAL DIST.: Serrania de Ajusco, 10,000 ft., August 18, 1896, *Pringle* (no. 11,858) (7).

OAXACA: Fl. vertes, août, sur les roches trachytiques à 11,500 pd., 1840, *H. Galeotti* (no. 5191) (21), (*Gymnadenia prasina* A. Rich.).—Fl. vertes, Cerro San Felipe, 8000 ft., November, 1840, *Galeotti* (no. 5053) (21) (type

ORCHIDACEÆ

of *Gymnadenia neottiioides* Rich. & Gal.).—Sierra de San Felipe, 10,000 ft., September, 1894, *Charles L. Smith* (no. 804) (4).—Sierra de Clavellinas, 9000 ft., October 16–19, 1894, *Smith* (no. 802) (4).—Cerro San Felipe, 9500–11,000 ft., 1894, *E. W. Nelson* (no. 1065) (2).—Near Reyes, alt. 7500–10,400 ft., October 17, 1894, *Nelson* (no. 1733) (2).—Chiapas, *Ghiesbreght* (no. 93) (3).

This species has been reported as follows:

MEXICO

MICHOACÁN(?): Real del Monte, *Hartweg* (type).

VERA CRUZ: Peak of Orizaba, 10,000–12,000 ft., *Liebmann* (nos. 141, 235, 242, 244).

17. *H. limosa* (*Lindl.*) *Hems.*, *Biol. Cent. Am.* 3: 305 (1884). *H. limosa*

*Platanthera limosa* *Lindl.*, in *Ann. Nat. Hist.* 4: 381 (1840); *Kränzl.*, *Orch. Gen. et Sp.* 1: 646 (1899), 943 (1901).

? *Gymnadenia propinqua* *Rich. & Gal.*, in *Ann. Sci. Nat.* ser. 3, 3: 30 (1845).

*Habenaria Thurberi* *Gray*, in *Proc. Am. Acad.* 7: 389 (1868).—*H. leucostachys* *Wats.*, in *Bot. Cal.* 2: 134 (1880) in part; *Hems.*, *Biol. Cent. Am.* 3: 305 (1884).

*Platanthera hyperborea* var. *leucostachys* *Kränzl.*, *Orch. Gen. et Sp.* 1: 642 (1899), 943 (1901) in part.

*Limnorchis Thurberi* *Rydb.*, in *Bull. Torr. Bot. Cl.* 28: 624 (1901) in part, excl. descr. & Californian specimens cited.—*L. arizonica* *Rydb.*, in *Bull. Torr. Bot. Cl.* 28: 629 (1901).

“PLATANTHERA (§ 1. a.) *limosa*; caule folioso, foliis ensiformibus erectis, racemo laxo multifloro, bracteis striatis acutis floribus brevioribus, petalis ovatis sepalisque obtusis, labello lineari convexo obtuso labello [calcare?] filiformi pendulo pluries brevior. —*Mexico*: In paludibus, Anganguco, juxta Asoleadero, Sept. Hartweg.” *Lindl. loc. cit.*

The type of *Gymnadenia propinqua* *Rich. & Gal.*, according

## ORCHIDACEÆ

*H. limosa* to notes made at Paris by Eaton, consists of a single specimen in bud which is unserviceable for a definitive conclusion regarding its position in synonymy. Judging from Richard's drawing it may be conspecific with *H. limosa*, although it may be referred also to *H. volcanica* with equal surety. *H. Thurberi* is similar to *H. limosa*. The type has a linear lip. It is difficult to comprehend Dr. Rydberg's treatment of *H. Thurberi*. He has confused it with *H. dilatata* var. *leucostachys*, and described as *Limnorchis Arizonica* material which agrees beautifully with Gray's type of *H. Thurberi*.

### NEW MEXICO, SOCORRO COUNTY

Along streams, Mogollon Mts., July 19, 1881, *H. H. Rusby* (no. 399) (2, 4); 8000 ft. alt., July 20, 1903, *O. B. Metcalfe* (no. 282) (4).

**H. elegans** var. **maritima** (*Greene*) comb. nov.—**H. ma-**

ORCHIDACEÆ

*H. elegans ritima* Greene, in *Pittonia* 2: 298 (1892), *Man. Bot. Bay Reg.* 306 (1894); *Kränzl.*, *Orch. Gen. et Sp.* 1: 467 (1898); *Jepson*, *Fl. Mid. Cal.* 132 (1901).

*Piperia maritima* Rydb., in *Bull. Torr. Bot. Cl.* 28: 641 (1901).

“HABENARIA MARITIMA. Very robust, only 6 to 16 inches high, at flowering time destitute of foliage, but the upper part of the stem bearing many lanceolate-subulate appressed and more or less imbricated green bracts  $\frac{1}{2}$  inch long or more: spike  $1\frac{1}{2}$  to 3 inches long, 1 inch thick, the flowers closely crowded, white, heavily honey-scented: sepals oblong, obtuse,  $1\frac{1}{2}$  lines long, white, with a narrow and delicate deep-green midvein; petals not quite equalling the sepals, oblong-lanceolate, the upper 2 plane, deep-green at base and well up the middle, otherwise white, the lip pure white even to the prominently elevated and broad midvein: spur slender, longer than the ovary.

“On dry hills near the sea at Point Lobos, near San Francisco, flowering from August to October; leaves probably appearing in early spring and soon dying. Species apparently referred to *H. leucostachys* in the State Survey Botany, but most distinct.”  
Greene, *loc. cit.*

*H. elegans* var. *maritima* differs from the type in its congested habit and more nearly white flowers. After an examination of numerous specimens I failed to find any structural differences which in my judgment warranted the maintenance of *H. maritima* as a distinct species. One can find a full series of specimens in one region connecting the variety with *H. Michaeli*, *Piperia multiflora* and the type. All these forms appear to be conditions of one species. The variety is found only under the influence of salt air of the littoral of California from San Francisco to Monterey County. Bolander's specimen, numbered 2490, in the Gray Herbarium, consists of a slender

## ORCHIDACEÆ

form of *H. elegans* and a fairly typical plant of *H. Michaeli*, *H. elegans* while his number 2429, from the same locality, is a transitional form between *H. maritima* and *H. multiflora*. Hartweg's no. 1976 is very similar to *H. Michaeli*. As the transition from one of these forms to the other is so complete, and as all often grow together, it has been impossible to distinguish centres of variation; therefore no attempt to do so has been made in the following list of localities.

### BRITISH COLUMBIA

Boggy places near Frazer River, August, 1883, *Fletcher* (6).

YALE DIST.: Rich woods, Sicamous, July 8, 1889, *J. Macoun* (6).

QUEEN CHARLOTTE ISLS.: Long Arm, Skiddegate, July 27, 1897, *Dr. C. F. Newcombe* (6).

VANCOUVER ISL.: Oregon Boundary Commission, 1858-9, *Dr. Lyall* (3).—Rocky bank of Prospect Lake, July 20, 1880, *Dr. Engelmann* (4).—Horne Lake, July 27, 1887, *Macoun* (2, 6).

VICTORIA Co.: Cold, mossy woods on hillsides, Victoria, August, 1883, *Fletcher* (3, 6).—Beacon Hill, Victoria, August 10, 1893, *Macoun* (no. 2821) (4, 6).—Sooke road near Victoria, August 5, 1893, *Macoun* (no. 2819) (2, 6, 9).—Deep woods near Sooke Lake, Angle, *M. A. Barber* (no. 173) (3).

### MONTANA, FLATHEAD COUNTY

Columbia Falls, August 18, 1894, *R. S. Williams* (no. 1034) (4).—September 1, 1896, *Williams* (no. 1034) (2).—Woods, McDonald's Peak, Mission Range, alt. 5000 ft., July 19, 1883, *Wm. M. Canby* (no. 307) (3, 16).—Woods, north of Flathead Lake, July 25, 1883, *Canby* (no. 307) (6).

### IDAHO, KOOTENAI COUNTY

Woods on St. Joseph River, Wiessner's Peak, 1800 m. alt., July 7, 1892, *Sandberg*, *MacDougal & Heller* (no. 584) (2, 3).—Priest River Forest Reserve, 700 m., August 9, 1897, *John B. Leiberger* (no. 176) (5).—Lower Priest River, August 9, 1897 (no. 2876) (2); copses, July, 1887, *J. H. Sandberg* (16); July, 1892, *Sandberg* (4).

SHOSHONE Co.: Shady woods, valley of north fork of Cœur d'Alene River, 950 m., August 13, 1895, *Leiberger* (no. 1527) (2).

LATAH Co.: Very dry fir woods, Moscow Mts., September 10, 1894, *L. F.*

ORCHIDACEÆ

- H. elegans* *Henderson* (2, 14).—Cedar Mts., June, 1899, *A. D. E. Elmer* (no. 1558) (7).  
 NEZ PERCÉS Co.: Near Forest, 3500 ft., July 16, 1896, *A. A. & E. G. Heller* (no. 3436) (2).  
 WASHINGTON Co.: Seven Devils Mts., 6000 ft., September 9, 1899, *Marcus E. Jones* (no. 6604) (4).

WASHINGTON

- 1899, *G. R. Vasey* (no. 78) (2).—Yakima Region, 1882, Transcontinental Survey, *T. S. Brandegee* (no. 475) (4, 16).—Near Lake Roothaan, September, 1860, Oregon Boundary Commission, *Dr. Lyall* (3).—Dry, grassy, slopes, 3000–3500 ft., Twenty-five Mile Creek, Washington Forest Reserve, August 9, 1897, *M. W. Gorman* (no. 570 in part) (2).—Nisqually Trail, August 17, 1889, *E. C. Smith* (4).  
 STEVENS Co.: Calispell Valley, August 8, 1902, *Frank O. Kreager* (no. 624) (2); August 10, *Kreager* (no. 624) (3).  
 OKANOGON Co. (?): Lake Wenatchee, 610 m., August 1, 1893, *Sandberg & Leiberg* (no. 647a) (2).  
 KITTITAS Co.: Mt. Stuart, August, 1898, *A. D. E. Elmer* (no. 1236) (2).  
 KING Co.: Seattle, June 26, 1889, *Smith* (4).  
 KITSAP Co.: August 3, 1889, *C. V. Piper* (no. 1081) (11).  
 YAKIMA Co.: Near Mt. Adams, 1883, *L. F. Henderson* (nos. 67, 68) (3).—Simcoe, July, 1880, *Joseph & Thos. J. Howell* (no. 353) (3).  
 WALLAWALLA Co.: Blue Mts., August 2, 1896, *Piper* (3).  
 KLUCKITAT Co.: Open woods, July 29 and August, 1885, *W. N. Suksdorf* (2, 4, 5, 6, 7, 9).—Flowers greenish, near Husum Post Office, July, 1905, *Suksdorf* (1).—Lower Cascade Mts., near Falcon Prairie, August 19, 1882, *Henderson* (10).

OREGON

- Columbia woods, *Nuttall* (3) (*H. falcata* in hb.).—1871, *E. Hall* (no. 506) (3, 4, 16).—Drain on Southern Oregon Railroad, August 9, 1880, *Geo. Engelmann* (4).—Grave Creek Hills, June 30, 1887, *Thos. Howell* (no. 1267) (2, 4).—Rocky places, June, 1881, *Howell* (9).  
 WASCO Co.: Under oaks and pines, July 14, 1896, *L. F. Henderson* (5, 14).  
 YAMHILL Co.: Open woods, North Yamhill, July 8, 1882, *Howell* (2).  
 JACKSON Co.: Wimer, July 29, 1892, *E. W. Hammond* (no. 364) (9).  
 JOSEPHINE Co.: Grant's Pass, July 27–28, 1903, *Alice Eastwood* (9).—Trail to Happy Camp, July 27–28, 1903, *Eastwood* (9).—Williams Creek, June 10, *Mrs. H. L. Durden* (9).

ORCHIDACEÆ

CALIFORNIA

*H. elegans*

1872, *Miss Mary J. Bancroft* (16).—*H. N. Bolander* (3).—*Hartweg* (no. 1976) (3, 19, 21).<sup>1</sup>—1868–9, *Kellogg & Harford* (no. 959) (3).—Under pines, Balenas Bay, *Brewer* (no. 2429) (3); under oaks, 1863, *Bolander* (no. 2490) (3).—Santa Lucia Mts., 1885, *T. S. Brandegee* (9).

SOUTHERN CALIFORNIA: 1876, *C. C. Parry & J. G. Lemmon* (no. 384) (3).—On steep, dry mountain slopes under pines, San Bernardino Mts., 4500 ft. alt., August, 1884, *S. B. & W. F. Parish* (no. 1699) (3, 8, 15).

SISKIYOU Co.: Mt. Eddy, 4500 ft., August 19, 1903, *E. B. Copeland* (no. 297b) (1).—Dry woods near Yreka, May 23, 1876, *E. L. Greene* (no. 804) (3).

SHASTA Co.: Fir woods, mountains about the head-waters of the Sacramento River, 5000 ft., August 14, 1881, *C. G. Pringle* (7).

PLUMAS Co.: 1875, *Mrs. Austin* (16).

MENDOCINO Co.: July, 1895, *Miss K. E. Cole* (9).—Mill Creek, June 23, 1901, *Alice Eastwood* (9).—Red Mt., August 4, 1902, *Eastwood* (9).

LAKE Co.: Foothills south of Mt. Sanhedrin, midway between Potter Valley and Hullville, July 15, 1902, *A. A. Heller* (1).

PLACER Co.: Dutch Flat, July, 1900, *Cole* (9).—Applegate, June, 1900, *Cole* (9).

ELDORADO Co.: Pyramid Peak, 1903, *Mrs. F. M. Meigs* (9).

AMADOR Co.: June 13, 1900, *J. C. Hawthorne* (no. 46) (9).—Agricultural Station, 2000 ft., June, 1893, *Geo. Hansen* (no. 42) (4).—Antelope, 4200 ft., July 28, 1896, *Hansen* (no. 1864) (2, 4).

SONOMA Co.: Cazadero, July 4–14, 1904, *Gwendolan Newell* (9).—Near Mark West Springs, June 28, 1902, *Heller* (1).

MARIN Co.: San Rafael, October, 1878, *Moore & Kellogg* (9).—Laguintas, August, 1894, *Eastwood* (9).—Rodeo Lagoon, September, 1902, *Eastwood* (9).—Sausalito, July, 1896, *Eastwood* (9).—Vision Hill, Tomales Bay, September 1, 1900, *Eastwood* (9).—Mt. Tamalpias, May, 1900, *Eastwood* (9); July 14, 1894, *Eastwood* (9); July 11, *Mrs. Brandegee* (2); July 21, *Mrs. Brandegee* (9); July 17, 1898, *Eastwood* (9).—Mill Valley, August 2, 1896, *Eastwood* (9).

SAN FRANCISCO Co.: September 19, 1892, *Michener & Bioletti* (4).—Land's End, August, 1900, *Eastwood* (9); September, 1895, *Eastwood* (2, 3, 9);

<sup>1</sup>Hartweg no. 1976, in the Muséum d'Histoire Naturelle de Paris, is very near the *Michaëli* form, having prominent squarrose bracts, but it is less stout. (A. A. E.)

ORCHIDACEÆ

- H. elegans* August 2, 1897, *Mrs. Brandegee* (3, 9).—Bluffs along the Golden Gate, September, 1895, *Eastwood* (3).—Point Lobos, March 25, 1893, *Michener & Bioletti* (4).
- ALAMEDA Co.: Dry hills, Oakland, July and August, *Brewer* (no. 2431) (3).
- SAN MATEO Co.: Crystal Springs near San Mateo, 1872, *A. Gray* (3).
- SANTA CLARA Co.: Near San José, June, 1879, *Mrs. A. E. Bush* (3).—Foothills west of Los Gatos, July 1, 1904, *Heller* (1).—Santa Cruz Mts., near Los Gatos, October, 1900, *Mrs. H. N. Wright* (9).
- SANTA CRUZ Co.: Santa Cruz, June 24, 1881, *M. E. Jones* (2).—Santa Cruz Mts., July 24, 1882, *C. G. Pringle* (7).—Glenwood, July, 1900, *Horace Davies* (9).—Mountains near Santa Cruz, *Bolander* (3).
- MARIPOSA Co.: Yosemite Valley, 1866, *Bolander* (no. 6252 in part) (3); July 5–19, 1902, *Eastwood* (9).—Near Yosemite, 1875, *John Muir* (4).—Mariposa, June 9, 1901, *J. W. Congdon* (9).—Grove of *Sequoia gigantea*, 1865, *J. Torrey* (no. 512) (3).
- FRESNO Co.: Sequoia Mills, July 19, 1892, *T. S. Brandegee* (9).—Dunlap, July 15, 1893, *Eastwood* (9).
- TULARE Co.: Kaweah River Valley, July 28, 1891, *Coville & Funston* (no. 1333) (2).—Three Rivers, May, 1894, *Eastwood* (9).
- MONTEREY Co.: Pacific Grove in pine woods, August 27, 1903, *Heller* (no. 7197) (1, 2, 3, 9); August, 1900, *Dr. Wilson* (9).—July 13, 1905, *Chas. Piper Smith* (no. 1028) (1); August 19, 1905, *Smith* (nos. 1099, 1100) (1).—Monterey, *Miss E. Cannon* (9); June 1–15, 1903, *Newell* (9).—In the woods, Rose Valley, August, 1900, *Wm. Barber* (9).—Pacific Valley, May, 1898, *R. A. Plaskett* (9).—Santa Lucia Mts., July 6, 1898, *Plaskett* (no. 167) (2, 5); July 6, 1898, *Plaskett* (no. 164) (9).—Point Sur, July, 1888, *Brandegee* (3, 9).
- SAN LUIS OBISPO Co.: San Simeon, June, 1887, *T. S. Brandegee* (9); June, 1884, *G. W. Michael* (9) (*H. Michaeli*); 1880, *Michael* (16).
- SANTA BARBARA Co.: Santa Cruz Isl., July and August, 1886, *Greene* (9).—Santa Rosa Isl., June, 1880, *Brandegee* (9).—Santa Inez Mts., near Santa Barbara, 1888, *Brandegee* (9).
- LOS ANGELES Co.: Under bushes, foothills of Sierra Santa Monica, June, 1891, *H. E. Hasse* (2).—Wooded volcanic region under Adenostoma, Avalon, Santa Catalina Isl., June, 1897, *Blanche Trask* (4, 9).
- SAN DIEGO Co.: San Jacinto, June or July, 1880, *S. B. & W. F. Parish*, (no. 669) (3, 15).—Cucamonga Mts., July or August, 1881, *S. B. & W. F.*

ORCHIDACEÆ

*Parish* (no. 1157) (3, 16), August, 1881 (no. 1157) (16).—Cuyamaca Mts., July, 1889, *C. R. Orcutt* (2, 3, 4) (*H. Orcuttii*, J. N. R[ose] in hb. Gray).—Talley's, 1875, *Dr. Edward Palmer* (no. 373) (3).—Mountains near Potrero, June 20, 1906, *Orcutt* (1). *H. elegans*

19. *H. unalascensis* (*Spreng.*) *Wats.*, in *Proc. Am. Acad. Bot. Cal.* 2: 277 (1877), *Bot. Cal.* 2: 133 (1880); *Coulter*, *Rocky Mt. Bot.* 342 (1885); *Macoun*, *Cat.* 4: 17 (1888); *Britton & Vail*, in *Bull. Herb. Boiss.* 3: 203 (1895); *Rattan*, *Fl.* 176 (1898); *Kearney*, in *Bail. Cycl. Am. Hort.* 2: 708 (1900); *Howell*, *Fl. Nw. Amer.* 628 (1902). *H. unalascensis*

*Spiranthes unalascensis* *Spreng.*, *Syst. Veg.* 3: 708 (1826).

*Habenaria Schischmareffiana* *Cham.*, in *Linnæa* 3: 32 (1828).

*Platanthera Schischmareffiana* *Lindl.*, *Gen. & Sp. Orch.* 286 (1835); *Steud.*, *Nomencl. ed. 2*, 2: 352 (1841); *Ledeb.*, *Fl. Ross.* 70 (1853).

*Herminium unalascense* *Reichb. f.*, *Orch. Eur.* 107, t. 65 (417) (1851); *Kränzl.*, *Orch. Gen. et Sp.* 1: 931 (1901). (See *Lindl.* in *Journ. Linn. Soc.* 1: 171.)

*Platanthera foetida* *Geyer*, ex *Hook. Journ. Bot.* 7: 376 (1855); *Kränzl.*, *Orch. Gen. et Sp.* 1: 640 (1899); *Piper & Beattie*, *Flora Palouse* 49 (1901).

*Habenaria foetida* *Wats.*, *Bot. King* 341 (1871).—*H. Cooperi* *Wats.*, in *Proc. Am. Acad. Bot. Cal.* 2: 135 (1880); *Orcutt*, *Fl. S. & Lower Cal.* 10 (1885); *Rattan*, *Fl.* 177 (1898).

*Herminium congestum* *Hook. f.*, *Fl. Brit. Ind.* 6: 130 (1890) in part; *King & Pantl.*, *Orch. Sik.-Him.* 335, t. 440 (1898) in part, not *Lindl.*; *Kränzl.*, *Orch. Gen. et Sp.* 1: 930 (1901).

*H. unalascensis*

*Neottia macrophylla* *Hook. f.*, Fl. Brit. Ind. 6: 130 (1890) in part.

*Spiranthes macrophylla* *Hook. f.*, Fl. Brit. Ind. 6: 130 (1890) in part; *Kränzl.*, Orch. Gen. et Sp. 1: 631 (1899) as syn., not *Spreng.*

*Platanthera unalascensis* *Kurtz.*, in Engl. Bot. Jahrb. 19: 408 (1895); *Kränzl.*, Orch. Gen. et Sp. 1: 631 (1899).

*Montolivæa unalascensis* *Rydb.*, in Mem. N. Y. Bot. Gard. 1: 107 (1900).

*Piperia unalascensis* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 270, 635 (1901), Fl. Col. 88 (1906); *Piper*, Fl. Wash. in Contr. Nat. Herb. 11: 208 (1906).—*P. Cooperi* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 636 (1901).—*P. lancifolia* *Rydb.*, in Bull. Torr. Bot. Cl. 28: 637 (1901).

“*unalascensis*\* 3. Sp. labello oblongo acutiusculo convexo discolore integerrimo sepalis patulis obtusis breviori, spica glabra, scapo aphylo, foliis radicalibus binis oblongis obtusis. *Ins. Aleut.*” *Spreng. loc. cit.*

The most conspicuous difference between *Habenaria unalascensis* and *H. elegans* is the comparative lengths of the spurs and lips. In *H. elegans* the spurs are usually long and slender and as a rule conspicuously longer than the lips. In *H. unalascensis*, on the other hand, the spurs are shorter than the lips.

The foliage of this species is very variable. Usually there are no leaves at the flowering season.

*Habenaria Cooperi* appears to be a luxuriant form of *H. unalascensis*. The type specimen in the Gray Herbarium is in a poor state of preservation, but the flowers which remain on the plant are sufficient to make comparisons possible. The labelum is broader than usual, and the scape is very stout, yet these characters are not sufficient to warrant specific distinction when attention is given to the normal variation of *H. unalascensis*.

## ORCHIDACEÆ

### QUEBEC

Mossy woods, Jupiter River, Anticosti Isl., August 20, 1883, *J. Macoun* (3); boggy places, Jupiter River, August 20, *Macoun* (16); open gravelly woods, August 20, *Macoun* (6).

*H. unalas-  
censis*

### ONTARIO

In bogs and swamps, Fishing Islands, Lake Huron, July 31, 1874, *J. Macoun* (6).—Lake Superior, June, 1860, *Wm. Boott* (3).

### ALBERTA

Crow Nest Pass, lat. 49° 30', August, 1897, *J. Macoun* (3); mountain slopes, Crow Nest Pass, 6500 ft., July 31, 1897, *Macoun* (6).—Along the base of Ship Mts., Waterton Lake, July 28, 1895, *Macoun* (6).—On sand or gravel, Bow River Pass, September 14, 1879, *Macoun* (no. 211) (3, 6).

### BRITISH COLUMBIA

Gravelly soil, Prospect Creek, July 18, 1888, *Dr. G. Dawson* (6).—MacLeod Lake, July 16, 1875, *Dawson* (3).—In boggy woods, vicinity of MacLeod Lake, July 14, 1879, *J. Macoun* (6).—West of Sophie Mt., International Boundary, between Kettle and Columbia Rivers, 4500 ft., July 11, 1902, *J. M. Macoun* (1).

YALE DIST.: Swampy woods, Batanie, near Spence's Bridge, July 6, 1890, *Dawson* (6).—Head-waters of Fraser River, July 21, 1898, *W. Spreadborough* (6).

VANCOUVER ISL.: Mt. Finlayson, June 28, 1887, *J. Macoun* (2).

ESQUIMALT DIST.: Gravelly banks, Goldstream, July 5, 1887, *Macoun* (6).

VICTORIA DIST.: Vicinity of Victoria, July 22, 1893, *Macoun* (2, 3, 6).

### ALASKA

Unalaska, *Chamisso* in itin. (3) (*H. Schischmareffiana*).—Bernhardi Hb. (4).

### MONTANA

Belt Mts., July 30, 1886, *R. S. Williams* (no. 521) (2).—Woods, head-waters of Joeko River, July 15, 1883, *Wm. M. Canby* (no. 308) (2, 7, 16).—Jack Creek Cañon, 7000 ft., July 15, 1897, *Rydberg & Bessey* (no. 3889) (2, 3, 5, 6).—Sixteen-Mile Creek, alt. 5000–6000 ft., July 12, 1883, *F. Lamson-Scribner* (no. 264) (16).—Foothills, Mission Range, July 19, 1883, *Canby* (no. 308) (16).

FLATHEAD Co.: Mountain near Columbia Falls, August 18, 1894, *Williams* (no. 521) (5).

## ORCHIDACEÆ

*H. unalas-*  
*censis*

MADISON Co.: Spanish Basin, Madison Range, 6000 ft., July 10, 1896, *J. H. Flodman* (no. 357) (2).

GALLATIN Co.: Wooded hillside, Mystic Lake, Bozeman, August 1, 1898, *J. W. Blankinship* (1).

### WYOMING, UINTA COUNTY

Woods, Yellowstone Park, August, 1884, *Frank Tweedy* (no. 10) (2, 16).

—In loose, loamy soil among the spruce and pines, Mammoth Hot Springs, July 21, 1899, *Aven & Elias Nelson* (no. 6033) (1, 2, 3, 4, 5, 9).

### UTAH, SUMMIT COUNTY

Parley's Park, 8000 ft., July, 1869, *Sereno Watson*, King Exp. (no. 1155) (2, 3).

### IDAHO

Mountains, July, 1892, *A. Isabel Mulford* (3, 4, 5).

SHOSHONE Co.: Dry ground amongst conifers, St. Mary's River, August 5, 1894, *L. F. Henderson* (2).

LATAH Co.: Meadows near Viola, July 26, 1892, *Sandberg, MacDougal & Heller* (no. 1039) (2, 3).

NEZ PERCÉS Co.: About Forest, 3500 ft., July 14, 1896, *A. A. & E. G. Heller* (no. 3429) (2, 4).

LEMHI Co.: Carmen Creek woods, near Freeman Mine, near Salmon, 6800 ft., August 27, 1895, *L. F. Henderson* (no. 4005) (2).

FREMONT Co.: Teton Cañon, July 23, 1872, *John M. Coulter*, Hayden Exp. (2, 16).

### WASHINGTON

1889, *Geo. R. Vasey* (nos. 79, 375) (2). — Dry ground among oaks and pines, Eagle Creek and Cascade Mts., June 11–August 17, 1882, *L. F. Henderson* (no. 940) (9). — Dry grassy slopes 3000–3500 ft., Twenty-five Mile Creek, Washington Forest Reserve, August 9, 1897, *M. W. Gorman* (no. 570 in part) (2). — Cascade Mts., 1882, *Brandegge* (no. 481) (4, 6); *Tweedy* (no. 336) (16). — Cascade Mts., 49° N. lat., 1859, *Dr. Lyall* (3). — West Kootenay, 1861, *Dr. Lyall* (3).

OKANOGAN Co.: Nason Creek, 650 m., July 30, 1893, *Sandberg & Leiberger* (no. 617) (2). — Damp land along Twisp River, July 19, 1896, *Kirk Whited* (2).

CLALLAM Co.: Olympic Mts., August, 1900, *A. D. E. Elmer* (no. 2552) (2, 4).

KING Co.: Seattle, May 21, 1889, *E. C. Smith* (4).

## ORCHIDACEÆ

KITTITAS Co.: Slopes of Mt. Stuart, 1400 m., July 24, 1893, *Sandberg & Leiberger* (no. 568) (2). *H. unalas-censis*

PIERCE Co.: Mt. Rainier, *O. D. Allen* (1, 3).

WALLAWALLA Co.: In woods, Blue Mts., July 15, 1896, *C. V. Piper* (1, 3); July 17, 1897, *Robert M. Horner* (no. 468) (2).

SKAMANIA Co.: Grassy ground in open pine forests, July 24–September 23, 1901, *W. N. Suksdorf* (no. 2690) (1).

KLICKITAT Co.: Woods, June, 1881, *W. N. Suksdorf* (2, 10, 16).—Falcon Valley, July, 1905, *Suksdorf* (1).

### OREGON

*Geyer* (no. 534) (3).—Columbia woods, *Nuttall* (*H. demodata* Nutt. in Brit. Mus.).—Dry soil, 4000 ft. alt., July, 1882, *W. C. Cusick* (no. 204) (16).—Rocky places, June, 1880, *Thos. J. Howell* (4, 16).—June, 1877, *Howell* (7).—June, 1881, *Howell* (9).—Dry mountains, shade, 4000 ft., July 28, *Cusick* (no. 2062) (3); *Cusick* (no. 2060) (2, 4).—1897, *E. P. *iana*

“3. HABENARIA *Chorisiana*. Nob.

“P. foliis subradicalibus duobus ovatis, labello integerrimo obtuso laciniis haud excedente, calcare scrotiforme.

“Habitat in montosis Unalasc hæ passim.

“*Satyrium* L.

“Transitum generis *Platanthera* in *Gymnadenias galeatas* Rich. demonstrans, superiori speciei affinis; diversa: statura minori vix digitali, foliis ovatis, spica pauci- 10–12 flora, bracteis instructa flores superantibus, cornu scrotiformi etc. Radix: tubera duo fusiformia, gracilia, descendencia, radiculis fibrosis paucis ad collum instructa. Folia vaginantia subradicalia duo, vagina externa aphylla accedente; externum inferumve latius atque obtusius, late ovatum, in speciminibus majoribus 16 lineas longum, 10 latum; internum superumve in aliis speciminibus approximatatum, in aliis paulo altius in caule situm, acutius et angustius; rete vasculosum e nervis primariis utrinsecus circiter 6 constans, arcuatis, in apicem submucronulatum conniventibus, venulis obliquis inter se connexis. Caulis digitalis, sæpius brevior, in unico specimine sexpollicaris, gracilis, supra parte nudus, unicove foliolo instructus sessili lanceolato acuto. Spica unguicularis pollicarisve 10–20 flora; bracteæ folio caulino similes, varia longitudine, floribus semper longiores; flores quam in præcedente specie minores, erecti. Germen simile, contortum, erectum, rectum, crassiusculum, maturo fructu ellipsoides. Calyx fornicatus, laciniis comparibus paulo discedentibus; laciniæ exteriores late lanceolatæ obtusæ; interiores consimiles paulo minores; labellum indivisum, obtusum, laciniis brevius, calcaratum, calcare brevi scrotiforme.” Cham. *loc. cit.*

<sup>1</sup> Kränzlin confused the details of *H. bracteata* on Reichenbach's plate with those of this species and prepared his diagnosis accordingly.

## ORCHIDACEÆ

The only material of *H. Chorisiana* which I have studied has been immature and unsatisfactory. In the Gray Herbarium there is a single specimen from Unalaska collected by Chamisso. The leaves, two in number, are basal or subradical. Above the leaves there is a single linear bract. The raceme is congested and bears buds only.

### ALASKA

*Chamisso* (3).—Said by Kränzlin to have been collected in Unalaska by *Eschscholtz*.

### JAPAN

According to Finet, *loc. cit.*

“*Scape* 8–12 inches high, bearing at the base two orbicular, oval or obovate leaves. *Leaves* fleshy, smooth and shining, 3–4 inches long. *Spike* 4–6 inches in length, somewhat loosely flow-

## ORCHIDACEÆ

ered. *Flowers* 10–20, yellowish-green, erect or a little spreading, *H. Hookeri* subsessile. *Bracteæ* lanceolate, nearly as long as the flowers. *Sepals* ovate-lanceolate, acute; the upper one connivent with the petals, erect; the lateral ones deflexed, so as to meet posteriorly. *Petals* a little shorter than the sepals, linear, very acute, dilated at the base. *Lip* lanceolate, acuminate, scarcely as long as the ovarium, standing forward and somewhat incurved. *Spur* straight, acute, depending, about twice the length of the ovarium. Cells of the *anther* linear-clavate, widely separated at the base by the broad stigmatic surface. *Ovarium*  $\frac{1}{2}$ – $\frac{3}{4}$  of an inch in length, straight." Gray, *loc. cit.*

The variety *oblongifolia* is surely only an individual variation. There is a specimen in the Gray Herbarium with leaves about 1 dm. long by about 4 cm. wide, collected at Little Falls, N. Y., by J. A. Paine, which is typical *H. Hookeri* var. *oblongifolia*.

In the third volume of the *Annals of the Lyceum of Natural History of New York*, on page 229, Gray published, presumably for the first time, the combination *Habenaria Hookeriana*, referring to "*Torrey, Herb.*" as authority for the name. In the library of the Gray Herbarium there is a copy of Gray's paper in quite a different edition of the *Annals*, in which the typography and pagination are not in agreement with the regular issue and in which, on page 228, *Habenaria Hookeri* is given instead of *H. Hookeriana*. This copy is accompanied by a manuscript note which states that the first impression was destroyed by fire. In my library there is a copy of the *Annals* bound up with the original covers. According to this copy it would appear that numbers 5, 6, and 7, in the last of which Gray's paper was published, were issued simultaneously in April, 1836. Beginning with these numbers the typography of the work changes. In the preceding numbers the typography is in agreement with that of

ORCHIDACEÆ

*H. Hookeri* Gray's copy to which reference has already been made. On the last page of the cover of the 1836 issue the following notice is printed: "The delay which has occurred in the publication of the present volume has been owing to a series of difficulties and misfortunes beyond the power of the Lyceum to guard against. The remaining numbers, comprising a *Monograph of the Cyperaceæ of North America* by Dr. Torrey, are now in the press, and will be speedily issued." Although Gray's paper was not regularly published before April, 1836, Lindley, in September, 1835, in his *Genera and Species of Orchidaceous Plants*, referred to the *Annals*, and adopted the specific name *Hookeri*. This leads naturally to the supposition that Lindley had a copy of the *Annals* similar to Gray's, and that originally Gray had adopted *Hookeri* and not *Hookeriana*. This also leads to the supposition that the first impression of Gray's paper may have been in the form of proof-sheets and not a valid publication. As Lindley's *Genera and Species of Orchidaceous Plants* on this assumption antedated Gray's paper in the second issue of the *Annals*, it would seem that *Hookeri* must stand as the correct name of the species. I have suggested 1835 as the date of the first impression of Gray's paper, as it was not read until December, 1834.

“In shady beech-woods: on the mountains of Pennsylvania and Virginia. ♀. July, Aug. v. v. Resembles *O. bifolia*. Two leaves of a fleshy texture are spread flat on the ground, between

## ORCHIDACEÆ

*H. orbiculata* which rises the stalk about a foot or eighteen inches high, which bears a loose spike of greenish-white flowers. It is known in the mountains by the name of *Heal-all*." Pursh, *loc. cit.*

In the herbarium at Kew there is a specimen of *Habenaria orbiculata* which appears to be the type. On the reverse of the sheet on which it is mounted, in the upper left-hand corner, the name "Fred Pursh" is written. Presumably, this specimen was obtained by Hooker when the Lambert collection was sold, as Lambert possessed Pursh's herbarium. The specimen in question is surely conspecific with *Platanthera Menziesii*.<sup>1</sup>

### LABRADOR

Labrador Swamp, Ryegate, July 8, 1884, *Dr. F. Blanchard* (4).

### NOVA SCOTIA, VICTORIA COUNTY

New Campbellton, July 23, 1897, *David White & Chas. Schuchert* (no. 25) (2).

INVERNESS Co.: Rich woods, Whycocomagh, July 20, 1883, *J. Macoun* (6).

### PRINCE EDWARD ISLAND, QUEENS COUNTY

Shady woods, Brackley Point, August 14, 1888, *J. Macoun* (6).

### NEW BRUNSWICK, VICTORIA COUNTY

Boggy woods, Little Tobique River, July, 1884, *Geo. U. Hay* (6). — Evergreen forest back of Clair's, July 11, 1904, *A. A. Eaton* (no. 93) (1).

NORTHUMBERLAND Co.: Woods, Nepisiquit River, August, 1902, *Robert Johnstone* (6). — Deep woods, Nepisiquit Lake, July, 1884, *R. Chalmers* (3).

ORCHIDACEÆ

24. *H. macrophylla* *Goldie*, in *Edinb. Phil. Journ.* 6: 331 (1822); *H. macro-*  
*Hook.*, *Exot. Fl.* 2: sub t. 145 (1825); *Torr.*, *Comp.* 318 (1826); *macro-*  
*Beck*, *Bot. ed.* 1, 349 (1833); *Ames*, in *Rho.* 8: 1, fig. (1906), in  
*Gray's Man. ed.* 7, 310 (1908); *Knight*, in *Rho.* 8: 188 (1906);  
*Macoun*, in *Ottawa Nat.* 20: 139 (1906).

*Platanthera orbiculata* *Lindl.*, *Gen. & Sp. Orch.* 286  
(1835), and of authors in part.

*Habenaria orbiculata* *Gray*, *Man. ed.* 5, 501 (1867), and of  
authors in part, not *H. orbiculata* *Hook.*

*Lysias orbiculata* *Rydb.*, in *Britton's Man.* 294 (1901) in  
part.—*L. macrophylla* *House*, in *Muhlenb.* 1: 127 (1906).

“*Habenaria macrophylla*, labello lineari-elongato integerrimo,  
anthera basi utrinque producta, cornu germine duplo longiore,  
foliis binis planis elliptico-orbiculatis.

“*Hab.* Moist shady woods, Island of Montreal. Very rare.

“Of all the Orchideous plants which I have seen in North  
America, this is, without a question, the largest and most striking.  
It must rank next to *Habenaria orbiculata* (*Orchis* of Pursh and  
Nuttall), having, like it, two plane, orbicular, approaching to  
elliptical, *leaves*, which spring from immediately above the fasci-  
culated root, and which, in this plant, are four times as large as  
those of *H. orbiculata*, measuring from six to eight inches in  
length, very thin and pellucid, beautifully marked with longitu-  
dinal and transverse veins. The *scape* is equally long in propor-  
tion, and is furnished with a few lanceolate scales. *Bractees* simi-  
lar to these, and shorter than the germen. *Flowers* large, white,  
resembling those of *H. bifolia*, and arranged in a lax spike of  
about five or six inches in length. The three *superior petals* are  
connivent, the *uppermost* is nearly orbicular, the others ovate,  
attenuated, the *two lateral* ones of the same shape, but much  
larger, reflexed, their bases decurrent with the *labellum*, which,

ORCHIDACEÆ

*H. macro-* standing forwards, is linear, as long as the germen, quite entire.  
*phylla* *Germen* about an inch in length, slender, tapering down into a footstalk. *Column of fructification* very short. *Anther* large, broad, much like that of *H. bifolia*, but having the base of the cells remarkably apart and elongated into two projecting horns. *Pollen-mass* yellow, with a very long footstalk, and a jointed gland at the base. *Stigma* large, viscid." Goldie, *loc. cit.*

CANADA

Goldie (20), type.

### NEW JERSEY

New Calverly (3).

BURLINGTON Co.: Swamps, Quaker Bridge, August, 1862, *Canby* (16).

CAMDEN Co.: Winslow, August, 1878, *Isaac C. Martindale* (2).—Griffith's, six and a half miles southeast of Philadelphia, August 10, *C. E. Smith* (3).

ATLANTIC Co.: Bogs near Egg Harbor City, July 28, 1878, *C. F. Parker* (no. 11,543) (4).

### PENNSYLVANIA

*T. C. Porter* (3).—*Muhlenberg* (13).

### DELAWARE

Sussex Cap, July, 1878, *Wm. M. Canby* (8).—Lewiston, July, 1878, *Canby* (3).

SUSSEX Co.: Meadows, Ellendale, August, 1874, *Canby* (16).—Swamps, Rehoboth, July, 1879, *Canby* (5).—Swamp, one mile south of Lewes, July 27, 1878, *Canby* (16).

### MARYLAND

Annandale (?) 1898, *Dr. Gerrit S. Miller* (2).

BALTIMORE Co.: Baltimore (3).

WORCESTER Co.: Ocean City, July 25, 1878, *A. Commons* (10, 16).

### VIRGINIA, NANSEMOND COUNTY

Near Suffolk, July 11, 1898, *Thos. H. Kearney, Jr.* (no. 1575) (2); July 18, 1898, *Kearney* (no. 1708) (2).

### NORTH CAROLINA

*In sylvis Carolina, florib. luteis, autumnus floret?* Hb. Michaux (21), type.

CHOWAN Co.: Edenton, July 29, 1898, *Thos. H. Kearney, Jr.* (no. 1890) (2).

WAKE Co.: Raleigh, September 13, 1897, *W. W. Ashe* (2).

HENDERSON Co.: Swamps of Muddy Creek, August 20, 1881, *John Donnell Smith* (2, 3).

CRAVEN Co.: Swamps near Newbern, July 21, 1897 (Biltmore Dist. no. 4887a) (2, 3, 4, 5); Newbern, July 31, 1898 (no. 1944), August 1, 1898, (no. 1964), *Thos. H. Kearney, Jr.* (2).

ORCHIDACEÆ

*H. cristata* CUMBERLAND Co.: Low ground, Fayetteville, August 13, 1903 (Biltmore no. 4887h) (5).

SOUTH CAROLINA, RICHLAND COUNTY

Small sphagnum swamp, Columbia, August 1, 1900 (Biltmore no. 4887d) (5).

AIKEN Co.: Aiken, August 27, 1866, *W. Ravenell* (4).

BERKELEY Co.: Summerville, August, 1893, *J. B.* (5).

BEAUFORT Co.: Beaufort district, 1886, *Dr. Mellichamp* (10).—Bluffton, 1873, *Mellichamp* (16).

GEORGIA, DODGE COUNTY

Moist pine barrens, Eastman, August 7, 1901 (Biltmore no. 4887g) (5).

SUMTER Co.: Moist pine barrens, July 26, 1901, *Roland M. Harper* (no. 1122) (2, 3, 4).

THOMAS Co.: Thomasville, August 4-14, 1903, *Mrs. A. P. Taylor* (1); July 18, 1905, *Mrs. Taylor* (1).

FLORIDA

*Chapman* (2, 4, 5, 8, 16).

DUVAL Co.: August, 1876, *A. H. Curtiss* (7).—Moist pine barrens near Jacksonville, August, 1877, *Curtiss* (no. 2758) (2, 4, 6, 8); August 6, 1894, *Curtiss* (no. 5120) (14).—San Pablo, July 25, 1896, *L. H. Light-hipe* (no. 440) (5).

MADISON Co.: Damp, dark, fertile hammock woods near a pond, August 2, 1898, *Combs* (2).

GADSDEN Co.: Quincy, September 4, 1895, *Geo. V. Nash* (no. 2560) (2, 3, 4).

WASHINGTON Co.: Swamps, Point Washington, August 10, 1901 (Biltmore no. 4887f) (5).

ST. JOHN Co.: St. Augustine, 1877, *Mary C. Reynolds* (8).

HERNANDO Co.: June-July, 1898, *A. S. Hitchcock* (4).

ORANGE Co.: Oviedo, July, 1904, *T. L. Mead* (1).—Sanford, July 29, 1895, *Nash* (no. 2274) (10).

ALABAMA, CULLMAN COUNTY

Cullman, August 5, 1896, *Chas. Mohr* (12).

TUSCALOOSA Co.: Low grassy pine barrens, June, *E. A. Smith* (12).—Wet soil, Tuscaloosa, August 1, 1899 (Biltmore no. 4887b) (5).

CLAY Co.: August 24, 1897, *F. S. Earle* (14).

## ORCHIDACEÆ

LEE Co.: Auburn, August 11, 1897, *F. S. Earle & C. F. Baker* (no. 739) *H. cristata* (4, 14).

BUTLER Co.: In swamps near Greenville, August 11, 1899 (Biltmore no. 4887c) (5).

MOBILE Co.: Mobile, 1872, *Wm. Harvey* (no. 39) (2); July 21, 1905, *W. C. Dukes* (1).—Common in swamp, Spring Mill, August 1, 1897, *B. F. Bush* (no. 87) (2, 4).

### MISSISSIPPI, HARRISON COUNTY

Biloxi, July 26, 1896, *C. L. Pollard* (no. 1038) (2, 3, 4, 5).—July 29, 1899, *S. M. Tracy* (no. 5080) (5).—July 23, 1897, *C. F. Baker* (14).

HANCOCK Co.: July 28, 1887, *H. V. Arnz* (4).

### TENNESSEE, PUTNAM COUNTY

Swampy ground, August 8, 1900 (Biltmore no. 4887e) (5).

COFFEE Co.: Tullahoma, August, 1878, *Dr. A. Gattinger* (7).

FRANKLIN Co.: Sewanee, August 1, 1878, *Gattinger* (8).

### ARKANSAS, PULASKI COUNTY

Little Rock, July, 1885 (11).

### LOUISIANA

*Hale* (3).—Paroisse des Rapides, 1839, *Prof. Steinhauer* (4).—Aldenbridge, November 1, 1898, *Wm. Trelease* (4).

× *H. Chapmanii* (*Small*) comb. nov. (*H. ciliaris* × *H. cristata*) × *H. Chapmanii*

***Blephariglottis Chapmanii*** *Small*, Fl. Se. U. S. 314 (1903).

“Roots coarse; stems 6–10 dm. tall: leaves few; blades broadly linear to linear-lanceolate, 1–2 dm. long or shorter above, acute, the lower ones with clasping bases, the upper reduced to sessile bracts: spikes cylindric, about 1 dm. long, 4 cm. thick, many-flowered: perianth deep orange: sepals about 4 mm. long, the lateral suborbicular, the other concave, often notched at the apex: lateral petals fan-shaped, 3.5–4 mm. long, pectinate-fringed: lip about 1 cm. long, the body linear, with a terminal drooping fringe of 6–8 simple or forking hair-like appendages and 2 basal stag-horn-like forking appendages: spur as long as the ovary or longer.

ORCHIDACEÆ

“Orchis nectarium labio lanceolato ciliato, seta germine intorto longiore. Roy. lugdb. 15. Gron. virg. 183.

“Orchis palmata elegans lutea americana, cum longis calcari-bus luteis. Moris. hist. 3, p. 499.

“Orchis marilandica grandis & procera, floribus luteis, calcari longissimo: lobulo fimbriato. Raj. suppl. 588.

“Habitat in Virginia, Canada. 2.” L. loc. cit.

In Catesby's Herbarium, preserved at the British Museum of Natural History, there is a very good specimen of this species together with two other specimens of the genus, probably *H. nivea* and *H. repens*. In the Gronovian Herbarium there is a specimen which has been identified as *Habenaria ciliaris* R. Br., accompanied by the following description: “*Orchis nectarium labio lanceolato ciliato, seta germine intorto longiore.*” Probably Gronovius confused two species in his work on the flora of Virginia.

## ORCHIDACEÆ

*H. ciliaris* is very rare in the northernmost part of its range. *H. ciliaris* With the exception of one collection from Vermont, which I refer to *H. ciliaris* with reasonable sureness, the species has not been reported from the United States north of Massachusetts. In the southernmost part of its range great variation may be expected, especially in the size of the raceme and the fringe of the labellum.

### ONTARIO, ESSEX COUNTY

Low sandy woods, Leamington, August 15, 1886, *Burgess* (6); in a swamp west of Leamington, July 24 and 25, 1892, *J. Macoun* (3, 6).

CRAIG Co.: Craig's, 600 metres, August 22, 1903, *E. S. Steele & Mrs. H. ciliaris Steele* (no. 75) (3, 4).

NANSEMOND Co.: About Suffolk, July 24, 1893, *Heller* (no. 1139) (3).

### NORTH CAROLINA

Middle North Carolina, *W. W. Ashe* (2); August 14, 1884, *G. McCarthy* (2); 1885, *McCarthy* (2).

WATAUGA Co.: Blowing Rock, August 9, 1893, *Mrs. B. L. Robinson* (3).

BUNCOMBE Co.: Moist woodland, Biltmore, August 5, 1896 (Biltmore no. 489) (5); dry woods, August 13, 1897 (Biltmore no. 489b) (2, 3, 4, 5).

CLEVELAND Co.: Base of King's Mt., August 1, 1902 (Biltmore no. 489e) (5).

POLK Co.: Spring Mountain Park, near Columbus, August 16, 1897, *E. C. Townsend* (2).

SWAIN Co.: Dry hillsides, Great Smoky Mts., 1700–4000 ft., July 15–August 15, 1891, *Beardslee & Kofoid* (2, 4).

HENDERSON Co.: Flat Rock, *L. Gibbs* (3).—Swamps of Muddy Creek, August 20, 1881, *J. D. Smith* (3).

NEW HANOVER Co.: Wilmington, 1881, *W. R. Smith* (2).

### SOUTH CAROLINA, LEXINGTON COUNTY

Moist soil, Batesburg, July 30, 1900 (Biltmore no. 489d) (5).

AIKEN Co.: Aiken, August, 1869, *H. W. R[avenell]* (2); August 16, 1866, *H. W. R.* (4).

BEAUFORT Co.: Bluffton, 1872, *Dr. Mellichamp* (4); 1873, *Mellichamp* (16).

### GEORGIA, FLOYD COUNTY

Rome, July, 1888, *Gerald McCarthy* (2).

RICHMOND Co.: Augusta, August, 1876, *A. Cuthbert* (10).

SCREVEN Co.: Scarborough, September, 1884, *E. W. Lang* (10).

SUMTER Co.: Rather dry pine barrens, July 24, 1901, *R. M. Harper* (no. 1108) (2, 3, 4).

NORTH Co.: Poulan, August 14 and 15, 1900, *C. L. Pollard & W. R. Maxon* (no. 552) (2).

COLQUITT Co.: Sphagnous bog along Ochlocknee Creek, near Moultrie, August 22, 1903, *R. M. Harper* (no. 1943) (1).

THOMAS Co.: Thomasville, August 21, 1897, *S. M. Tracy* (no. 3535) (2, 4, 14); July 6, 1902, August 4, 25, September 1, 1903, July 18, 1905, *Mrs. A. P. Taylor* (1).

## ORCHIDACEÆ

### *H. ciliaris* FLORIDA

East Florida, *Dr. Edward Palmer* (no. 546) (2, 3).

WALTON Co.: De Funiak, July, 1896, *P. H. Rolfs* (no. 692) (4); marsh lands along streams, mostly in open places, common, August 12, 1898, *Combs* (2).

CALHOUN Co.: Swamps and bogs, Wewahitchka, August, 1896, *Chapman* (Biltmore no. 489a) (2, 3, 5).

ST. JOHN Co.: St. Augustine, May 20, 1886, *Mary C. Reynolds* (2).

LAKE Co.: Flat woods, Eustis, August 1-15, 1894, *George V. Nash* (no. 1534) (2, 3, 4, 5, 10, 14).

MANATEE Co.: Pine barrens, Manatee, August 3, 1890, *J. H. Simpson* (14).

### ALABAMA

*Prof. Alexander Winchell* (2).

TALLADEGA Co.: Talladega Springs, July 17-19, 1900, *C. L. Pollard & W. R. Maxon* (no. 244) (2).

TUSCALOOSA Co.: Wet borders of streams, common, Tuscaloosa, July 31, 1878, *E. A. Smith* (12).

TALLAPOOSA Co.: August 21, 1897, *F. S. Earle* (14).

COOSA Co.: Low ground, Goodwater, July 31, 1902 (Biltmore no. 489f) (5).

LEE Co.: Auburn, August 15, 1897, *Earle & Baker* (4, 14).

MOBILE Co. (?): Common in swamp, Spring Hill, August 4, 1897, *B. F. Bush* (no. 91) (4).

### MISSISSIPPI, JACKSON COUNTY

Scranton, August 5 and 6, 1896, *C. L. Pollard* (no. 1194) (2, 3, 4, 5).

HARRISON Co.: Ocean Springs, August 2, 1889, *F. S. Earle* (1); August 1, 1895, *J. Skehan* (4).—Biloxi, July 25 and 26, 1896, *Pollard* (no. 1025) (2, 3, 4); August 3, 1900, *S. M. Tracy* (no. 7013) (5).

### TENNESSEE

Near summit of Great Smoky Mts., 1895, *Frank E. Moore* (2).

DICKSON Co.: Pond Station, July 23, 1886, *A. Gattinger* (8).—Craggy Hope, August 10, 1882, *Gattinger* (8).

LINCOLN Co.: Low ground in oak barrens, Elora, July 27, 1899 (Biltmore no. 489c) (5).

COFFEE Co.: Tullahoma, *A. Gattinger* (5, 8); August, 1878, *Gattinger* (7).—Sewanee, August, 1878, *Gattinger* (8).

MONROE Co.: White Cliff Springs, July, 1890, *F. Lamson-Scribner* (8).

## ORCHIDACEÆ

COCKE Co.: Within three miles of Wolf Creek Station, August 30, 1897, *H. ciliaris* Thos. *H. Kearney, Jr.* (no. 909) (2, 4, 14).

### OHIO, LUCAS COUNTY

Ten miles west of Toledo, August 1, 1898, *E. L. Moseley* (2).

### INDIANA, STEUBEN COUNTY

Low open clearing one-half mile north of Clear Lake, July 24, 1904, *Chas. C. Deam* (1); prairie conditions around Clear Lake, August 21, 1904, *Deam* (1).

LAKE Co.: Swales, Miller's, August 13, 1897, *L. M. Umbach* (2, 5).—Gibson's, August, 1870, *Henry H. Babcock* (4).

### ILLINOIS

July, 1874, *H. H. Babcock* (2, 7).

### MICHIGAN

Whitmore Lake, August, 1857, *Fritchey* (4).

INGHAM Co.: Cold swamps, Lansing, September 1, 1883, *L. H. Bailey, Jr.* (3).—Agricultural College, July 28, 1890, *G. H. Hicks* (3).—Towar's Swamp, near Agricultural College, July 23, 1894, *F. Wheeler* (?) (11).

### MISSOURI, RIPLEY COUNTY

Rare dry pine woods five miles north of Pleasantgrove, July 25, 1897, *K. K. MacKenzie* (no. 425) (4).

### ARKANSAS

Swamps, southwest Arkansas, August, *F. L. Harvey* (no. 76) (4, 10, 11, 16).

PULASKI Co.: Little Rock, June, 1885 (11); July, 1886, *Dr. H. E. Hasse* (2).

GARLAND Co.: Springy places, Hot Springs, August, 1879, *G. W. Letterman* (4); August, 1904, *Miss E. A. Douglas* (4).

### LOUISIANA

Red River, *Hale* (?) (3).

### TEXAS, HARDING COUNTY

Long-leaf pine belt, July, 1884, *G. C. Neally* (3).

× *H. Canbyi* Ames, in Rho. 10: 70 (1908), in Gray's Man. ed. 7, × *H. Canbyi* 310 (1908). (*H. blephariglottis* × *H. cristata*.)

*Labellum* about 7 mm. long, deeply fringed, more closely resembling *H. cristata* than *H. blephariglottis*; *spur* 12 mm. long, more or less intermediate between the parent species. The length of the spur is of great value in the identification of the hybrid.

ORCHIDACEÆ

× *H. Canbyi* DELAWARE, SUSSEX COUNTY

“*Habenaria cristata* × *blephariglottis*? Intermediate in color, size of flowers, openness of panicle, &c., between the two species.” Swamp near Lewes, Delaware, in company with *H. cristata* and *H. blephariglottis*, July 27, 1878, Wm. M. Canby (16).

*H. blephariglottis*

27. *H. blephariglottis* Hook.,<sup>1</sup> Exot. Fl. 2: t. 87 (1824); Lodd., Bot. Cab. t. 925 (1824); Spreng., Syst. Veg. 3: 690 (1826); Torr., Comp. 317 (1826); Sw., Adnot. Bot. 46 (1829); Beck, Bot. ed. 1, 348 (1833); Gray, in Ann. Lyc. Nat. Hist. N. Y. 3: 230 (1836); Paxt., Mag. 2: 183 (1836); Torr., in Geol. & Nat. Hist. Surv. N. Y. 174 (1840); Eaton & Wr., N. A. Bot. ed. 8, 259 (1840); Dewey, Herbaceous Pl. Mass. 198 (1840); Darby, Bot. S. St. 527 (1866); Gray, Man. ed. 5, 502 (1867), ed. 6, 509 (1890), Field, For. & Gard. Bot. 325 (1868), rev. ed. 408 (1895); Miller & Young, Pl. Suffolk Co. L. I. 13 (1874); Willis, Cat. N. J. 61 (1874); Yale Cat. 45 (1878); J. Robinson, Fl. Essex Co. 108 (1880); Britton, Prel. Cat. N. J. 94 (1881); Perkins, Gen. Cat. Vt. 37 (1882); Dudley, Cayuga Fl. 96 (1886); Gattinger, Tenn. Fl. 83 (1887); Macoun, Cat. 4: 19 (1888); Owen, Pl. Nantucket 58 (1888); Bennett, Pl. R. Eng. 113–115 (1894); Moran, in Journ. des Orch. 6: 254 (1895); Britton & Br., Ill. Fl. 1: 465 f. 1108 (1896); Deane, Fl. Met. Park 79 (1896); Creevey, Fl.

<sup>1</sup>Hooker bases his species on *Orchis blephariglottis* Willd., but he figures the form which was later segregated by Lindley as *Platanthera holopetala*. The consensus of opinion of those who have done close field-work is that var. *holopetala* is untenable, all conditions of petals from entire to fringed sometimes being found on the same spike. See *Bulletin of the Torrey Botanical Club* 20: 86. Niles, in *Bog-trotting for Orchids*, designated a yellowish form as var. *holopetala*. (A. A. E.)

ORCHIDACEÆ

Field, Hill & Swamp 80 (1898); *Clute*, Fl. Up. Susq. 106 *H. blephariglottis* (1898); *Meehan*, Monthly 8: 113, t. 8 (1898); *Kearney*, in Bail. Cycl. Am. Hort. 2: 707 (1900), in Contr. U. S. Nat. 25 cm. long, 1–2 cm. broad, the remaining ones gradually be-

## ORCHIDACEÆ

*H. blephariglottis* var. *conspicua* coming shorter and passing into the bracts of the inflorescence; spike ovate to oblong, 6–12 cm. long, 5–7 cm. in diameter; flowers numerous, white; tube of the calyx 2–2.5 cm. long, the sepals orbicular or nearly so, 7 mm. in diameter; petals oblanceolate, about 5 mm. long, from nearly entire to more or less toothed at the apex; lip 12–15 mm. in length, narrowly oblong, the claw 4–5 mm. long, the blade deeply fimbriate; spur curved, narrowly cylindrical, 4–5 cm. in length.

“Collected on the edge of a sphagnum bog at Lake City, Columbia Co. [Fla.], No. 2501, and observed at a number of other places. It was distributed in my collection of 1894 under No. 1700, as *H. blephariglottis*, from which it is abundantly distinct, the larger flowers, longer spur, and deeply fimbriate lip readily separating it.” Nash, *loc. cit.*

Although characteristic plants of this variety are easily separable from the type, intergrading forms occur which make any attempt at distinction purely arbitrary.

### NORTH CAROLINA

1847, *Met Curtis* (4).—Wet savannahs, eastern North Carolina, July and August, *G. M. McCarthy* (2, 16).

CRAVEN Co.: Newburn, July 31, 1898, *Thos. H. Kearney, Jr.* (no. 1939) (2); August 1, 1898, *Kearney* (no. 1979) (2).

CUMBERLAND Co.: Bogs near Fayetteville, August 13, 1903 (Biltmore no. 4966d) (5).

NEW HANOVER Co.: Wilmington, 1881, *W. R. Smith* (2).

BRUNSWICK Co.: August 15, 1884, *McCarthy* (2).

### SOUTH CAROLINA, BEAUFORT COUNTY

Bluffton, 1873, *Dr. J. H. Mellichamp* (16).

### GEORGIA, CHATHAM COUNTY

Moist grassy pine barrens, Savannah, August 17, 1900 (Biltmore no. 691b) (5).

CHARLTON Co.: Sphagnum bog two miles east of Folkstone, August 12, 1902, *R. M. Harper* (no. 1508) (2, 3, 4).

## ORCHIDACEÆ

WORTH Co.: Vicinity of Poulan, August 14–15, 1900, *C. L. Pollard & W. R. Maxon* (no. 584) (2). *H. blephariglottis* var. *conspicua*

COLQUITT Co.: Sphagnous bog along Ochlocknee Creek, near Moultrie, August 22, 1903, *R. M. Harper* (no. 1944) (1).

THOMAS Co.: Thomasville, August and September, 1903, *Mrs. A. P. Taylor* (1, 7); August 4, 1902, *Mrs. Taylor* (1).

### FLORIDA, DUVAL COUNTY

Jacksonville, 1875, *A. H. Curtiss* (2); waste places in Jacksonville, August, 1877, *Curtiss* (no. 2757) (2, 3, 4, 7, 8); August 14, 1893, *Curtiss* (no. 4178) (2); springy places near Jacksonville, August 10, 1894, *Curtiss* (no. 5145) (2); margin of swamp in pine barrens near Jacksonville, August 30, 1900, *Curtiss* (no. 6707) (2, 3, 4, 7).

COLUMBIA Co.: Lake City, August 29–31, 1895, *Geo. V. Nash* (no. 2501) (2, 3, 4, 10) (type number of *H. conspicua*).

LIBERTY Co.: Swamps, August 26, 1901 (Biltmore no. 691c) (5).

FRANKLIN Co.: Apalachicola, *Chapman* (4); swamps, Apalachicola, July–August, *Chapman* (Biltmore dist. no. 4966b) (2, 3, 4, 5).

LAKE Co.: Vicinity of Eustis, August 16–25, 1894, *Nash* (no. 1700) (2, 3, 4, 10).

ORANGE Co.: Swamps, August 19, 1902, *A. Fredholm* (no. 5497) (3).

### ALABAMA, WINSTON COUNTY

1866, *T. M. Peters* (16).

TUSCALOOSA Co.: Tuscaloosa, *Dr. E. A. Smith* (12).

BUTLER Co.: Swamps, Greenville, August 11, 1900 (Biltmore no. 4966d) (5).

MOBILE Co.: Mobile, *C. Mohr* (12).—Biloxi, September 6, 1900, *F. E. Lloyd & S. M. Tracy* (no. 315) (1).

### MISSISSIPPI, JACKSON COUNTY

Ocean Springs, August 30, 1889, *F. S. Earle* (1).

HARRISON Co.: Beauvoir, September 4, 1898, *S. M. Tracy* (no. 5079) (2, 4, 14).

"3. *O. leucophæa*. Labello tripartito, laciniato, maximo; laciniis lateralibus internis obovatis crenulatis; cornu filiformi clavato, germine longiore.—*Hab.* In moist prairies near Kiamesha, Red river. Flowering in June.—*Obs.* Probably the largest species in the United States; the stem being from eighteen inches to two and a half feet high; leaves oblong-lanceolate, diminishing into narrow lanceolate bracts, about the length of the germ; flowers white, a little tinged with green; the lateral segments of the petaloid calix ovate, and less than half the length of the lip, which is divided into three dilated segments, divided nearly to the base into many capillary portions. It is more nearly allied to *O. incisa* than *psycodes*, but differs from the former in the laciniated lip, and from the latter by the multiplicity of its segments, and the obovate instead of linear form of the two internal petaloid divisions." Nutt. *loc. cit.*

## ORCHIDACEÆ

21 (1860); *Wood*, Class-book 685 (1861); *Paine*, Pl. Oneida Co. *H. psychodes* 84 (1865); *Portl. Cat.* 7 (1868); *Tracy*, Essex Fl. 81 (1892); *Correvon*, Orch. Rust. 175 (1893); *Kränzl*, Orch. Gen. et Sp. 1: 607 (1899), 939 (1901), excl. syn. *Lindl.*, *Ait.*, &c.—*P. fimbriata*  $\beta$  *floribus minoribus* *Hook.*, Fl. Bor. Am. 2: 200 (1839).

*Blephariglottis psychodes* *Rydb.*, in *Britton's Man.* 296 (1901); *Small*, Fl. Se. U. S. 314 (1903), in *Porter's Fl. Pa.* 94 (1903); *C. B. Robinson*, in *Bull. Pictou Acad.* 1: 35 (1907).

It is a hopeless task to attempt to arrive at satisfactory conclusions regarding the correct synonymy of *Habenaria psychodes* and *H. fimbriata*. Early in the history of these closely allied species confusion was established, and although several authors have endeavored to eliminate it there are obstacles which it is probable will always exist. Botanists have reported their material under one name or the other, and have, with few exceptions, added confusion by unstudied references to literature.

For example, *Lindley* described two varieties of *H. psychodes* which are clearly referable to *H. lacera*, as an examination of his specimens will prove. In his synonymy he refers directly to *Orchis psychodes* L. His *Platanthera crispa*, on the other hand, which he suggested was a natural hybrid, is equivalent to *H. psychodes*, to which species his material identified as *P. incisa* should also be referred. *Lindley's* material of *P. fimbriata* is conspecific with *H. psychodes*, and his *P. grandiflora* is simply *H. fimbriata*.

The difficulties are increased tenfold when it is realized that *H. psychodes* and *H. fimbriata* are so similar that they are distinguishable only by arbitrary rules. In the preparation of the *Orchidaceæ* for *Gray's New Manual* a conscientious effort was made to ascertain the distinctive characters of these two species. Although every conspicuous character was carefully studied it was found that the most reliable distinction was the depth of

## ORCHIDACEÆ

*H. psycodes* the fringe on the divisions of the labellum; in *H. psycodes* this being one-third the depth of the divisions or less, and in *H. fimbriata* one-third or more.

It may be found that my treatment of the synonymy is in part incorrect, but it is offered as a basis for further research. (PLATE 66.)

PLYMOUTH Co.: Low woods, Scituate, August 13, 1899, *E. F. Williams* (3).

### RHODE ISLAND, PROVIDENCE COUNTY

Providence, 1846, *Geo. Thurber* (3).

### CONNECTICUT

1857, (D. C.) *Eaton* (3).

TOLLAND Co.: Coventry, August 3, 1891, *Gertrude Hakes* (2).—Somers, August 16, 1901, *A. W. Driggs* (3).

HARTFORD Co.: Hartford, August 2, 1900, *A. W. Driggs* (3).—Swampy

## ORCHIDACEÆ

meadow, Churchill Street, Southington, August 5, 1900, *C. H. Bissell* (3); *H. psycodes* bogs, frequent, Southington, August 14, 1897, *Bissell* (5).

FAIRFIELD Co.: Low grounds, infrequent, Bridgeport, July 22, 1892, *E. H. Eames* (2).—Weston, August 13, 1885, *A. L. Winton, Jr.* (2).

### NEW YORK, ESSEX COUNTY

July 31, 1893, *Miss Fanny Page Robinson* (2).—Keen Valley, August 1, 1891, *Hermann Schrenk* (4).

JEFFERSON Co.: Evans Mills, August 6, 1879, *Lester F. Ward* (2).

HERKIMER Co.: Border of marshes, Litchfield, August 3, 1901, *Dr. J. V. Haberer* (no. 887) (3).

SARATOGA Co.: Border of the pond above the northwest corner of Still-water village, 1867 (?), *Dr. Asa Fitch* (10).—Bear Pond, French Mt., July 27, 1899, *Stewart H. Burnham* (1).

ONEIDA Co.: Along Bear Creek, White Lake, Forestport, July 12, 1903, *Dr. J. V. Haberer* (no. 2679) (1).

ONONDAGA Co.: Near Syracuse, July, 1895, *M. L. Overacker* (5).

YATES Co.: Penn Yan, *T. Marshall Fry* (1).

CHENANGO Co.: Oxford, July 12, 1884, *F. V. Coville* (2).—Bainbridge, July 20, 1897, *D. LeRoy Topping* (2).

TOMPKINS Co.: Little Swamp, north part of Caroline, August 1, 1885, *O. E. Pearce* (2).

SCHUYLER Co.: Cayuta Lake, July 30, 1878, *Wm. Trelease* (4).

DELAWARE Co.: North Harpersfield, August 6, 1897, *Topping* (2).

### NEW JERSEY, SUSSEX COUNTY

Stockholm, August 10, 1894, *Wm. M. Van Sickle* (2).—Wet woods, Cranberry Lake, July 31, 1904, *Kenneth K. Mackenzie* (no. 820) (1).

ESSEX Co.: Franklin, August, 1874, *H. H. Rusby* (10).

UNION Co.: Summit Mt., July 29, 1898, *John C. Buchheister* (1).

### PENNSYLVANIA, LUZERNE COUNTY

Lily Lake, July 29, 1889, *A. A. Heller* (3).

### DELAWARE, NEWCASTLE COUNTY

Woodland swamp near Wilmington, June, 1860, *Wm. M. Canby* (16).

### DISTRICT OF COLUMBIA

Indian River, August 6, 1879 (2).

### VIRGINIA, GRAYSON COUNTY

Slope of Mt. Rogers, 4800–5000 ft., June 29, 1892, *John K. Small* (2, 3, 4).

## ORCHIDACEÆ

### *H. psycodes* NORTH CAROLINA, MITCHELL COUNTY

Roandale Farm, June 24, 1895, *A. G. Wetherby* (no. 160) (2).—North side of Roan Mt., 5000 ft., July 7, 1902, *W. A. Cannon* (no. 60) (2); woodlands, Roan Mt., June, 1868, *Wm. M. Canby* (16).

SWAIN Co.: Ravines, 4000 ft., July 16, 1891, *Beardslee & Kofoid* (3).

### OHIO, CUYAHOGA COUNTY

Near Cleveland, *Wm. Krebs* (1).

MEDINA Co.: Swamps, Brunswick, July, 1897, *G. B. Ashcroft* (5).

SUMMIT Co.: Copley Swamp, Akron, July 21, 1889, *Dr. Kent O. Foltz* (2).

### MICHIGAN, KEWEENAW COUNTY

Clifton, June, 1884, *O. A. Farwell* (11).

DELTA Co.: Escambia, *Henry H. Babcock* (2).

KENT Co.: Grand Rapids, June 22, 1895, *W. E. Mulliken* (5).

JACKSON Co.: Rich woods, July 3, 1896, *S. H. & D. R. Camp* (5).

WAYNE Co.: Palmer Park, Detroit, August 1, 1903, *O. A. Farwell* (11).

CASS Co.: July 30, 1886, *H. J. Webber* (4).

### INDIANA, STEUBEN COUNTY

East side of Clear Lake, in low thick woods, July 24, 1904, *Chas. C. Deam* (1).

### ILLINOIS

*M. S. Bebb* (3).

### WISCONSIN

Chippewa River, 1864, *T. J. Hale* (16).—Black River, 1861, *Hale* (3).—1861, *Hale* (4).

POLK Co.: Wet thickets, August, 1892, *H. F. Burglehaus* (4, 6).

BROWN Co.: July 20, 1878, *J. H. Schuette* (1).—*Flint D. Clark* (8).—Peaks Point, Green Bay, July 24, 1891, *J. H. Schuette* (1).—Scott, near Comfort, August 4, 1901, *Schuette* (1).—Marsh meadow on the bay, July 20, 1878, *Schuette* (1).

LA CROSSE Co.: La Crosse, *L. H. Pammel* (3).

MILWAUKEE Co.: Milwaukee, *I. A. Lapham* (4).

### MINNESOTA, ST. LOUIS COUNTY

Fond du Lac, July, 1889, *F. F. Wood* (no. 393) (2).

MILLELACS Co.: Milaca, July, 1892, *E. P. Sheldon* (2, 5, 14).

CHISAGO Co.: Chisago City, July 29, 1891, *J. H. Sandberg* (no. 679) (2).—Center City, August, 1892, *B. C. Taylor* (5, 14).

HENNEPIN Co.: Bogs, Fort Snelling, July 20, 1888, *Dr. W. H. Forwood* (2).

ORCHIDACEÆ

IOWA, FAYETTE COUNTY

“Rare, only one specimen reported before in Iowa,” Fayette, July, 1893,  
*B. Fink* (2).

*H. psychodes*

× *Habenaria Andrewsii* *White*, ex Niles Bog-trotting for × *H. An-*  
 Orchids 258, fig. (1904); *Ames*, in Gray's Man. ed. 7, 311 (1908). *drewsii*  
 —*H. psychodes* × *lacera Andrews*, in Rho. 2: 114 (1900),  
 3: 246 (1901); *Ames*, in Rho. 5: 263 (1903); *Eggleston*, in Rho.  
 6: 139 (1904).

“Lower leaves as in *H. lacera* length to 15 cm., width to 3 cm.,  
 ratio 5–7: 1. Raceme oblong, loosely fewer-flowered. Flowers  
 white tinted rose to light rose-purple. Sepals round-oval, obtuse,  
 lateral deflexed, plane, vertical. Petals cuneate-spatulate, obtuse  
 or slightly retuse, denticulate above, slightly surpassing upper  
 sepal in ratio of about 6: 5. Average width of lip about 12 mm.  
 Divisions narrow-cuneate, deeply cleft as in *H. lacera*, few,  
 averaging twice as many as in *lacera*, capillary, long. Arms of  
 column as in *H. psychodes* or slightly more acute. Glands of  
 pollen-masses slightly oblique, elliptical or slightly kidney-shaped.  
 Pollen-masses intermediate in length, club-shaped; stalk  $\frac{3}{4}$  length  
 of mass of pollen or rather more; pollen greenish-yellow. Some-  
 what two-lobed projection from base of stigma not completely  
 obstructing orifice of nectary in middle as in *lacera*. Spur longer  
 than ovary, clavate, much enlarged below. Ovary short or inter-  
 mediate, 9–12 mm. Locality—a very wet meadow in Pownal,  
 Vermont, July 22, 1898 (*M. W. White* & *A. L. Andrews*), Aug. 5,  
 1901 (*A. L. Andrews*).” *Andrews, loc. cit.* (PLATE 66.)

NOVA SCOTIA, PICTOU COUNTY

Damp meadow near Pictou, July 12–18, 1901, *C. D. Howe* & *W. F.*  
*Lang* (no. 546) (3).

MAINE, FRANKLIN COUNTY

South Chesterville, *Miss L. O. Eaton* (1).

ORCHIDACEÆ

× *H. Andrewsii*

VERMONT, BENNINGTON COUNTY

Wet meadow, Pownal, August 5, 1901, *A. L. Andrews* (3); August 4, 1902, *Andrews* (1).

## ORCHIDACEÆ

488 (1897); *Reichb. f.*, in Ber. Deut. Bot. Gesell. 3: 274 (1885); *H. distans* Kränzl., in Engl. Bot. Jahrb. 16: 61 (1893), Orch. Gen. et Sp. 1: 194 (1897); *Small*, Fl. Se. U. S. 315 (1903); *Urban*, in Symb. Antill. 4: 162 (1905); *Cogn.*, in Urban Symb. Antill. 6: 300 (1909).

“184. *HABENARIA DISTANS* Gr. radicellis villosis tuberiferis, caule basi foliato (1' alto), foliis elliptico-oblongis acutis (4"—6" longis), racemo paucifloro: floribus distantibus: bracteis membranaceis oblongo-lanceolatis ovario duplo brevioribus, perigonii segmentis exterioribus lateralibus reflexis ovato-lanceolatis (4''' longis), superiori ovato obtusiusculo, interioribus bipartitis eorumque segmento anteriori falcato-lineari descendente posteriorem subæquante, hoc oblongo, labello ad basin trisecto: segmentis linearibus, lateralibus patentissimis incurvis, medio longiori, calcare filiformi descendente versus basin compresso-clavellato (8'''—10''' longo) ovarium subæquante v. excedente.—*Habenaria* n. sp. Lindl. Orch. Wr.—Cuba or., pr. Monteverde (Wr. 1481) E.” Griseb. *loc. cit.*

*Habenaria jamaicensis* Fawcett & Rendle is a closely allied species characterized in part by the short anterior divisions of the petals.

*H. distans* is an extremely rare plant in Florida, where it appears to have been collected only once, in 1878, by A. P. Garber. No other collection has been made in Florida of which I have any knowledge.

The Cuban specimens collected by Wright, which constitute the type of *H. distans*, are large plants very unlike the specimens from Florida.

FLORIDA, LEE COUNTY

Caloosa, August, 1878, *A. P. Garber* (1, 2, 3, 4, 5, 7, 16).

*H. distans* CUBA

## ORCHIDACEÆ

### PLATE 67. *Habenaria jamaicensis*

Plant, natural size, drawn from a dried specimen collected in Jamaica by W. Harris (no. 10,499). 1. Flower, to show comparative lengths of the divisions of the petals and labellum. 2. Petal. The flower and petal drawn, enlarged, with the aid of the camera lucida.

ORCHIDACEÆ

*H. jamaicensis*

Pedicels about 5 mm. l. Flowers greenish. Sepals, dorsal 6–7 mm. l., 4.5–6 mm. br., lateral 6.5–9 mm. l., 3.5–4 mm. br. Petals, posterior segment 5.5–7 mm. l., 1.5–2 mm. br.; anterior segment 1.5–2 mm. l. Lip, middle lobe, 6.5–10 mm. l., about 1 mm. br.; lateral 9–12 mm. l.; spur 13–16 mm. l.

“*Hab.*—On rocky, or clayey, shady banks, in flower Dec.–April, Mt. Hybla, 4000 ft., 7851; Clydesdale, 4000–4500 ft., 7854; Moody’s Gap, 3000 ft., 7768; near Cinchona, 4500 ft., 10,449;<sup>1</sup> *Harris*.”

“Resembles *H. distans* Griseb. in the aggregation of the leaves at the base of the stem, and generally in the shape of the leaves, though those of *H. distans* are longer. Grisebach’s species also differs in the bracts being about as long as, or longer than, the flower; and in the anterior segment of the petal being about equal to the posterior.” Fawcett & Rendle, *loc. cit.*

The very short anterior division of the petals is characteristic, and readily distinguishes *H. jamaicensis* from *H. distans*. Cogniaux is inclined to regard this as a variety of *H. distans*.

JAMAICA

two species. It is highly probable that *H. pauciflora* should include both *H. setifera* and *H. spathacea*, but my material has been insufficient for a definitive conclusion regarding *H. pauciflora*. *H. pauciflora* appears to be confined to tropical South America.

Tarapota, *Spruce* (no. 4953) (20).

Reported as follows:

### COLOMBIA

Antioquia, *Kalbreyer* (no. 1915).

37. *H. mesodactyla* *Griseb.*, Fl. Br. W. Ind. 644 (1864); *H. mesodactyla* *Kränzl.*, in Engl. Bot. Jahrb. 16: 101 (1893), Orch. Gen. et Sp. 1: 256 (1897); *Cogn.*, in Urban Symb. Antill. 6: 302 (1909).

“225. *H. mesodactyla*, *Gr.* (*n. sp.*). Slender; leaves linear-setaceous, distant; flowers very distant in a 3–5-flowered spike:

*H. meso-* bracts ovate-lanceolate, acuminate, *little exceeded by the* incurved  
*dactyla* ovary; perigonial divisions exterior lateral reflexed, oblong-lanceolate, superior deltoid, 2 interior 2-partite: their anterior segments setaceous, twice as long as the linear posterior ones; *lip* 3-partite: *segments filiform: middle twice as long as the lateral ones: spur little shorter than the ovary, filiform, somewhat clavate, descending;* appendages of the stigma short, thickish, rounded. — Nearly allied to the preceding,<sup>1</sup> with which it grows intermingled (*Cr.*), and some characters depend perhaps upon the more advanced state of development in which this was collected. Habit and proportions the same, but stem rather higher, flowers more distant, and lip-segments narrower. — HAB. Trinidad, *Cr.*, in savannahs, Piarco." Griseb. *loc. cit.*

I have seen no specimens of this species. In my herbarium there is an excellent sketch of the material in the Kew Herbarium, for which I am indebted to the kindness of Dr. D. Prain. This sketch shows a slender plant with wand-like stems and linear, bract-like leaves. The inflorescence is loose, somewhat one-sided, and few-flowered. Contrary to the description published by Grisebach, the middle division of the labellum, as shown by the sketch, is much shorter than the lateral divisions. The material from which the sketch was prepared was collected in Trinidad by Dr. Crueger, and was used by Grisebach in his work on the *Flora of the British West Indian Islands*; consequently the discrepancy between the description and the material at Kew is of unusual interest.

Kränzlin, in *Orchidacearum Genera et Species*, states that the anterior division of the petals is longer than the posterior division, but not twice longer, as described by Grisebach, and he describes the labellum as tripartite, with the middle division about twice as long as the lateral ones. (PLATE 70.)

<sup>1</sup>*H. setacea*, which Cogniaux has described as *H. Cruegeri*.

HABENARIA

*mesodactyla* Grisebach

HABENARIA *Leprieuri* Reichb.

## ORCHIDACEÆ

### PLATE 70

I. *Habenaria mesodactyla*. Drawn from a sketch, prepared by M. Smith, of the specimens collected in Trinidad, British West Indies, by Dr. Crueger (no. 66), and preserved in the herbarium at the Royal Botanic Garden, Kew. 1. Flower. 2. Labellum and column. 3. Petal.

II. *Habenaria Leprieuri*. Flower drawn from a dried specimen collected in Trinidad, British West Indies, by W. E. Broadway. 4. Petal. 5. Labellum. Flower and parts drawn, enlarged, with the aid of the camera lucida.

*H. Leprieuri* 38. *H. Leprieuri* Reichb. f., in Linnæa 19: 376 (1847), in Walp. Ann. 1: 798 (1848), Otia bot. Hamb. 2: 50 (1881); *Warm.*, Symb. Fl. Bras. pt. 30, 91, t. 8, f. 1 (1884-5); *Kränzl.*, in Engl. Bot. Jahrb. 16: 101 (1893), Orch. Gen. et Sp. 1: 256 (1897); *Cogn.*, in Mart. Fl. Bras. 3, pt. 4, 47 (1893), in Urban Symb. Antill. 6: 301 (1909).

“12. *Habenaria Leprieuri*: spica pauci-(2-6-)flora, floribus distantibus, bracteis ovatis acutis ovario (in speciminibus observatis prope maturo) brevioribus, perigonii phyllis externis ovatis obtusiusculis, internis minoribus falcatis, cum phyllo superiore galetis, labello tripartito, laciniis lateralibus filiformibus divaricatis, media lanceolata obtusiuscula, lobis lateralibus subæquali, calcare filiformi ovario amplo apice breviter attenuato multo brevior. (Lindl. Gen. et Orch. ad A. § 2. C.)

“Zierliche, sehr zarte, fusshohe, steif aufgerichtete Pflanze mit 3-4 linealen, spitzen Blättern, durch das Trocknen schwarz.

“Cayenne, Leprieur. 1839! Im Herbar des Hern. von Delessert und im eignen, von demselben mitgetheilt.” Reichb. f. *loc. cit.*

I place here specimens gathered in Trinidad (British West Indies) by W. E. Broadway. The flowers agree well with the figure in Warming's *Symbolæ ad Floram Brasiliæ* and with the description published by Cogniaux in *Mart. Fl. Bras.* The setaceous, or narrowly linear, leaves are distinctive when compared with other species in our range. The raceme, however, of one of Broadway's specimens is composed of twenty or more flowers, differing in this respect from the type. The number of flowers may be extremely variable.

The general habit of Broadway's material suggests *H. mesodactyla*, but the flower is unlike the drawing prepared from the specimens preserved in the Kew Herbarium. The material from which my illustration is taken is presumably referable to *H. Leprieuri*. Broadway's specimens are of unusual interest, as they

## ORCHIDACEÆ

exhibit a wide range of variation in the form of the inflorescence *H. Leprieuri* and in the relative proportions of the divisions of the petals and labellum. Cogniaux's observations tend to show that great variation may be expected in the anterior division of the petal, this being either well developed or much reduced. Warming's figure shows the anterior division of the petal to be more slender than in the material chosen for illustration here. (PLATE 70.)

—*H. setacea Griseb.*, *Fl. Br. W. Ind.* 644 (1864), not *Lindl.*

“Tuberidiis parvis, ovoideo-oblongis, villosis; caule subfiliformi, breviusculo, basi vaginato, supra sparse vaginato; foliis erectis, rigidiusculis, lineari-setaceis, non carinatis, basi longiuscule vaginantibus; racemo breviusculo, laxe 5–8-floro; bracteis membranaceis, ovato-lanceolatis, acutissime longeque acuminatis, leviter ventricosis, ovario circiter æquilongis; floribus subsecundis; sepalis trinerviis, dorsali ovato, obtuso, lateralibus paulo longioribus, deflexis, triangulati-lanceolatis, acutiusculis; petalis bipartitis, partitionibus æquilongis, sepalo dorsali paulo brevioribus, postica lineari-ligulata acuta, antica erecta setacea; labello carnosulo usque ad basin tripartito, partitionibus subæqualibus, sepalis lateralibus æquilongis, anguste linearibus, lateralibus acutiusculis, intermedia vix latiore obtusa; calcare pendulo, filiformi-clavato, obtuso, ovario æquilongo; processibus stigmaticis brevibus, crassis, rotundatis.

*H. Cruegeri* “*Habenaria setacea* Griseb. ! *Flor.* (1864), p. 644 (non Lindl.!).

“Tuberidia obtusa, paulo obliqua, 10–12 mm. longa. Caulis strictus vel leviter flexuosus, teretiusculus, 12–35 cm. altus,  $\frac{1}{2}$ –1 mm. crassus. Folia tenuiter trinervia, limbo 2–4 cm. longo basi 1–2 mm. lato, vagina 1–3 mm. longa. Racemus rectus, 3–8 cm. longus. Bracteæ adpressæ, basi amplexicaules, 8–13 mm. longæ. Flores erecto-patuli, virescentes. Ovarium anguste lineari-fusiforme, leviter arcuatum, 10–11 mm. longum. Sepala submembranacea, dorsale satis concavum, 3 mm. longum, 2 mm. latum, lateralia subplana, leviter obliqua,  $3\frac{1}{2}$ –4 mm. longa,  $1\frac{1}{2}$  mm. lata. Petalorum partitiones subrectæ,  $2\frac{1}{2}$  mm. longæ. Labellum deflexum, partitionibus leviter divergentibus,  $3\frac{1}{2}$ –4 mm. longis; calcar rectum, 1 cm. longum, inferne  $\frac{1}{3}$  mm. superne  $\frac{2}{3}$  mm. crassum. Capsula erecta, leviter arcuata, fusiformis, crasse 6-costata, 14–16 mm. longa.

“Hab. in Trinidad ad Aripo et Piarco, fl. et fr. V: Crueger n. 49 et 67.” Cogn. *loc. cit.*

Among the orchids collected by Crueger in Trinidad, and described by Grisebach in the *Flora of the British West Indian Islands*, there were two closely allied species of *Habenaria*, one of which Grisebach referred to *H. setacea*. Subsequent studies have proved that *H. setacea* does not come within our range. Professor Cogniaux has recently decided that Grisebach’s *H. setacea* is an undescribed species; and in Urban’s *Symbolæ Antillanæ* it appears under the name *H. Cruegeri*.

*H. repens* 40. *H. repens* Nutt., Gen. 2: 190 (1818); Elliott, Sketch 2: 489 (1824); Spreng., Syst. Veg. 3: 692 (1826); Lindl., Gen. & Sp. Orch. 310 (1835); Eaton & Wr., N. A. ORCHIDACEÆ

*H. repens* BRAZIL, SANTA CATHARINA  
At Blumenau, *Ule* (no. 873).

*H. Pringlei* 41. *H. Pringlei* *B. L. Robinson*, in *Proc. Am. Acad.* 26: 184 (1891); *Kränzln.*, *Orch. Gen. et Sp.* 1: 188 (1897).—*H. macroceratitis* *Kränzln.*, *Orch. Gen. et Sp.* 1: 192 (1897) in part, as syn., 1: 887 (1900), not *Willd.*

“*HABENARIA PRINGLEI*. Roots mostly fibrous, but the central one tuberous: stem 3 feet high: leaves sheathing, ensiform, carinate, 6–8 inches long, an inch in breadth, gradually tapering to a long point: bracts lanceolate, sharply acuminate, 2 inches long, 5 lines broad; flowers about 10, large, pedicels 18 lines long; the ovary of equal length: sepals ovate, acuminate, minutely cuspidate, 8–9 lines in length; the upper one erect, scarcely at all galeate; lateral petals 2-cleft to the base, the segments linear, acute, the upper broader, not equalling the sepals; the lower very narrow, more than an inch in length: lip 3-cleft nearly to the base, exceeding an inch in length; the segments all narrow and linear, the lateral somewhat surpassing the thickish, scarcely acute central one: fleshy processes very conspicuous, linear-spatulate, 3–4 lines in length: spur over 5 inches long, exceeding the ovary and pedicel, its tip sheathed in the bracts and apparently adherent to them.—Near Guadalajara, June, 1891 (n. 3823). This striking species is related to *H. macroceratitis*, *Willd.*, and *H. setifera*, *Lindl.*, but differs from the former in its much longer narrower leaves, larger flowers, and conspicuous fleshy appendages; from the latter, by its larger more numerous flowers, and in the shape of its petals.” *Robinson, loc. cit.*

This is a very distinct species which should not be confused with *H. macroceratitis*. *Kränzlin*, in *Orchidacearum Genera et Species* 1: 188, recognized it as distinct, but on page 192 referred

ORCHIDACEÆ

it to the synonymy of *H. macroceratitis*. This treatment is incomprehensible as the same specimen is cited by Kränzlin under both *H. Pringlei* and *H. macroceratitis*. If number 3823 of Pringle's Mexican collections is a mixture, this fact is not mentioned in Kränzlin's work. As *H. Pringlei* is reduced to synonymy on page 192, it is presumable that Kränzlin reversed his conclusions, indicated on page 188, in subsequent examinations of material (cf. p. 887 *Orch. Gen. et Sp.*). The elongated, ensiform leaves, broad divisions of the petals and labellum, shorter spur, and very characteristic inflorescence are only a few of the salient details which serve to distinguish *H. Pringlei* from *H. macroceratitis*.

*Habenaria Habenaria* Small, Fl. Se. U. S. 316 (1903).

“98. ORCHIS *habenaria*. *Caulis* pedalis. *Folia* ovato-oblonga, 10 vel ultra, sensim minora. *Bracteæ* ovatæ, acuminatæ, germinibus breviores. *Germina* pollicaria. *Petala* 3 superiora conniventia, subcrenata; lateralia 2 ovato-oblonga, patula. *Labium* tripartitum: intermedia lineari, petalis paulo longiore; lateralibus duplo longioribus. *Cornu* filiforme, dependens, petalis 10-plo longius.” L., Amoen. Acad. *loc. cit.*

The specimen in the Linnæan Herbarium is in an excellent state of preservation. Its origin is not indicated by notes of any kind. Walter's *Orchis habenaria* is conspecific with *H. lacera*.

*H. macroceratitis* var. *brevicalcarata* *Ames*, in *J. D. Smith Enum. Pl. Guat.* pt. 7, 51 (1905), nomen.

This is a peculiar plant which resembles *H. macroceratitis*. The leaves are oblong-lanceolate, acute, 1.5 dm. long, 2.7–3.5 cm. wide. The spurs are about 8 cm. long, slender, gradually thickened toward the tip. The filiform, lateral divisions of the labelum are rolled inwards, or somewhat coiled and twice longer than the intermediate, linear division. My material consists of a single specimen.

“Orchis setacea? *Jacq. am.* 220.

“Satyrium. I. *Brown. jam.* 324.

“*Jamaica, Hispaniola.* 2.” Sw. *loc. cit.*

I have been unable to discover the type material of *Habenaria monorrhiza*. In the British Museum, where many of Swartz's specimens are preserved, I found nothing to throw light upon it. Lindley regarded *H. maculosa* distinct from *H. monorrhiza*, but, in my estimation, on insufficient evidence. Several authors have regarded *H. monorrhiza* Br. and *H. alata* Hook. conspecific. Reichenbach, however, indentified as *H. monorrhiza* specimens collected in Porto Rico by Sintenis, which are identical with *H. maculosa*. He also referred *H. maculosa* to the synonymy of *H. monorrhiza*, thereby upholding the views which are entertained in the present volume. Lindley laid stress on the fact that Swartz described a flower which was characterized by simple, undivided petals, but the extreme delicacy of the anterior segment of the petals of *H. monorrhiza*, which renders them easily breakable, he failed to take into account. Furthermore Swartz described the labellum of his flowers as three-parted with the lateral division setaceous, a characterization hardly applicable to *H. alata*. There is no Jamaican *Habenaria* of which

## ORCHIDACEÆ

I have any knowledge that is characterized by a three-parted *H. monor-*  
labellum and simple petals; therefore, unless it is assumed that *rhiza*  
Swartz overlooked the filamentous anterior division of the petals  
in the specimen he described as *Orchis monorrhiza*, there is no  
species known to us which fits his description.

In a recent publication on Jamaican orchids Fawcett & Rendle  
compare *H. socialis* with *H. alata* Hook., and apparently sustain  
the views held by Reichenbach. Cogniaux, on the other hand, in  
Urban's *Symbolæ Antillanæ*, gives *H. alata* Hook. as a synonym  
of *H. monorrhiza* Br., and refers to *H. maculosa* the species  
which is here identified with *H. monorrhiza*. Unfortunately  
Cogniaux does not discuss the matter and in his citation of  
specimens makes no allusion to Swartz's type.

“*Hab. in Mexico, de Karwinski. (exam. s. sp. in hb. Reg. Monac.)*

“*Vix pedalis. Folia sensim in bracteis decrescentia. Flores mediocres. Sepalum supr. cum pet. galeatum. Processus carnosus magni convexi glabri.*” *Lindl. loc. cit.*

*H. crassicornis* "97. *H. adenantha* Nob. Subglandulosa: foliis elliptico-lanceolatis; flor. viridibus glandulosis, sepalis internis lanceolatis, appendice lineari angustissimo: labelli lobis linearibus glandulosis; calcare inflato ovarii longitudine." Rich. & Gal. *loc. cit.*

Galeotti's type (no. 5051) is represented at Paris by a single individual, a drawing by Richard of a plant, "no. 83, Juguila à 6500 ft.," and a drawing of a flower and details. The plant is a very characteristic one of *H. crassicornis*, the thick semi-oblong apex of the spur ascending from a very slender basal portion, giving the whole flower the appearance of an ichneumon fly, the setaceous divisions of the perianth bearing a striking resemblance to the legs, the lateral sepals to the wings, the dorsal sepal to the thorax and head, and the spur to the abdomen. (A. A. E.)

*H. crassicornis* is very clearly distinguished from nearly related species by the minutely glandulose or denticulate petals and lip. The ovary is also glandulose along the angles or wings. In the drawing at Paris this denticulate character is clearly exhibited, although in the original diagnosis of *H. crassicornis* no reference to it is made by Lindley.

In all the specimens of *H. crassicornis* I have examined this denticulate or glandulose character is evident, but I did not look for it in Lindley's specimen,—at least I made no note relating to it. Lindley's sketch which accompanies the type exhibits a perfectly smooth flower, as figure 2, plate 72 shows. In all other respects this sketch suggests the flowers of *H. adenantha* Rich. & Gal. Dr. Prain, in a communication received December 17, 1909, assures me "that the flowers of *Habenaria crassicornis* are, in Lindley's original specimen, covered with little rough points." This observation disposes of uncertainty.

Dr. Kränzlin disregards *H. adenantha* in *Orchidacearum Genera et Species*, and in his account of *H. crassicornis* makes

“HABENARIA SCHAFFNERI. Stem stout, 8 inches high, covered with imbricated ovate or ovate-lanceolate sheathing, acute or acuminate leaves 1 to 1½ inches long: bracts large, foliaceous, much exceeding the ovary; raceme short, few- (6–8-) flowered: flowers large, 5 or 6 lines long; lower sepals lanceolate, acutish, the upper broadly elliptical, obtuse, carinate; petals 2-parted, the lower segments very narrow, the upper oblong-falcate, contiguous or subcoherent to the sepal; lip 3-lobed above the base, 5 lines long, the middle lobe narrowly ligulate, the lateral narrowly linear; spur an inch long or more, dilated toward the end and very acuminate: oblong processes of the stigma and beaks of the anther 1½ lines long.—In the

ORCHIDACEÆ

San Miguelito Mountains (5088 Schaffner, 1876) and near San Luis Potosi (860 Parry and Palmer, 1878); under pines in the Sierra Madre, Chihuahua (1375a Pringle, Sept., 1887)." Wats. *loc. cit.* *H. Schaffneri*

The type specimen of *H. Schaffneri* in the Gray Herbarium is in an excellent state of preservation. In general habit it has the appearance of a robust form of *H. clypeata*. *Lateral sepals* about 1 cm. long. *Upper sepal* 1 cm. long, galeate, about 6 mm. wide. *Petals*: posterior division 1 cm. long; anterior division slightly longer, slender, erect. *Labellum* three-lobed, lateral lobes subfiliform, arising about 5 mm. from the opening to the spur, about 11 mm. long, middle lobe fleshy, linear-oblong, about 7 mm. long from the point of origin of the lateral lobes to the tip. The *spur* resembles that of *H. crassicornis*.

Not *H. lactiflora* *Kränzl.*, in *Engl. Bot. Jahrb.* 16: 124 (1893), nor *Orch. Gen. et Sp.* 1: 296 (1898), as to reference to *Reichb. f.*—*H. clypeata* *Reichb. f.*, in *Linnæa* 28: 381 (1856) as syn.

“98. *H. lactiflora* *Nob. tab. 39.*<sup>1</sup> *Foliis ellipticis acutis; flor. albis, sepalo superiori dorso cristato, sepalis internis lanceolatis:*

<sup>1</sup>These tables were never published. The drawings are inserted with the specimens at the Paris Museum. (A. A. E.)

*H. lactiflora* labelli lobis lateralibus versus mediam partem enatis linearibus, intermedio ovali, oblongo, obtuso." Rich. & Gal. *loc. cit.*

No type of *H. lactiflora* is designated, and it is clear that Richard referred specimens of *H. diffusa* and *H. clypeata* to it, as may be seen by specimens at Paris. (Richard's drawing is of *H. clypeata*?) Certainly Galeotti no. 5218 is not the type, as it has a question mark after it; yet its aspect is more like what must be held as *H. lactiflora*. There is a drawing in the Lindley Herbarium that shows a flower very much like Heyde & Lux no. 3858 (which I refer to var. *buccalis* Reichb. f.). This species may be distinguished readily from *H. clypeata*, which it closely resembles, by the lateral arms arising from near the middle of the lip and the oblong mid-lobe. Lindley's drawing shows these characters perfectly. (A. A. E.)

PLATE 73. *Habenaria lactiflora*

I. Plant, etched from a photograph of Richard's drawing preserved in the Muséum d'Histoire Naturelle de Paris. 1. Flower, copied from a tracing of a flower in Lindley's herbarium. 2. Flower, enlarged, drawn from the Heyde & Lux specimen in Hb. Ames. 3. Petal.

Figs. 2 and 3 drawn, enlarged, with the aid of the camera lucida.

ORCHIDACEÆ

*H. lactiflora* the sketch in Lindley's herbarium at Kew, and a flower taken  
var. *buccalis* from the plant collected by Heyde & Lux, which Eaton referred  
to var. *buccalis*.

Great caution should be observed in considering the characters of the labellum. The origin of the lateral arms follows no definite rule, and is more likely to cause confusion, if relied on, than to assist in specific distinction.

In my opinion *H. lactiflora* and *H. clypeata* are very closely allied, and will be found to offer no satisfactory characters on which to establish two distinct species.

The position of the var. *buccalis*, on the other hand, is not clear.

More material than I have seen and a thorough study of types are necessary to establish certainty regarding *H. clypeata* and its allies.

“24. *HABENARIA* clypeata.

“*H. foliis* parvis ovatis cuspidatis sensim decrescentibus, racemo multifloro, bracteis foliaceis cucullatis acuminatis ovario brevioribus, petalis bipartitis: laciniis anterioribus linearibus horizontalibus posticis cum sepalo supremo rotundato galeam orbiculatam planam efficientibus, labelli penduli tripartiti laciniâ intermediâ lineari-lanceolatâ lateralibus linearibus paulò longiore, calcare compresso ovarii longitudine.

“Hab. in *Mexico*, de *Karwinski*. (*exam. s. sp. in hb. Reg. Monac.*)

“Caulis pedalis. Racemus oblongus, multiflorus. Galea orbiculata plana facie omninò peculiari hanc speciem induit.” Lindl. *loc. cit.*

There is no type specimen of this in Lindley's herbarium, but it is quite probable that sketches of a plant, flower, and petal therein contained were made from Karwinski's material, which should be in the royal herbarium at Monaco. That these sketches were from this source is the more likely as similar sketches represent the other species founded on Karwinski's collection. If this view is correct, these sketches prove that the general conception of *H. clypeata* held by authors is the correct one. It is represented by a mixture of two or three species in the herbaria of Kew, the British Museum, and the Muséum d'Histoire Naturelle de Paris. Perhaps the most closely related species is *H. lactiflora* Rich., which may be distinguished by the lateral divisions of the broader labellum that arise from near its middle and reach beyond the mid-lobe. In *H. clypeata* the lateral lobes arise from near the base of the middle lobe which they scarcely

ORCHIDACEÆ

*H. clypeata* equal in length. Dr. Kränzlin refers *H. jaliscana* Wats. and *H. guadalajarana* Wats. to *H. clypeata*. It is highly probable that he would have refrained from doing so had he studied the type specimens of *H. jaliscana* and *H. guadalajarana*. Dr. Kränzlin also refers *H. flexuosa* Lindl. to *H. clypeata*. His reasons for adopting this course are not given in detail.

*H. alata* *Rich. & Gal.* in Ann. Sci. Nat. ser. 3, 3: 29 (1845), not  
*Hook.*—*H. clypeata* *Kränzl.*, Orch. Gen. et Sp. 1: 313 (1898)  
in part.

“HABENARIA JALISCANA. A foot high from a small tuberous root, stout and leafy: leaves lanceolate, or the lower ovate, acute, sheathing, 3 inches long or less: raceme short and open, with large foliaceous bracts: sepals ovate, acute, nearly equal (4 lines long), the lateral sub-falcate; petals 2-parted and the lip 3-parted, the divisions strongly falcate excepting the ligulate-spatulate obtuse middle lobe of the lip, its longer (6 lines) lateral lobes and the lower lobes of the petals approximate on each side, linear, acuminate, the upper petal-lobes contiguous to the upper sepal; spur narrowly clavate, 12 to 15 lines long: column with

ORCHIDACEÆ

*H. jaliscana* fleshy oblong appendages at base,  $1\frac{1}{2}$  lines long; stigmatic processes  $1\frac{1}{2}$  lines long. Rio Blanco in moist bottoms; August. (343). — Flowers greenish yellow. This (as the following) may be some one of the species named by Richard & Galeotti, but their descriptions certainly do not apply to the specimens." *Wats. loc. cit.*

*H. jaliscana* resembles *H. Schaffneri*. In the mature flowers, however, the spur is much more slender than in *H. Schaffneri* and about 3 cm. long. The anterior divisions of the petals are unusually long, as is shown in the specimen from which Richard prepared his drawing of *H. alata*.

Pringle's no. 4508 as represented by specimens in my herbarium agrees in almost every detail with the type of *H. alata* Rich. & Gal., preserved in the herbarium of the Muséum d'Histoire Naturelle de Paris. Richard's material is in excellent condition for comparative studies. The specimens collected by Galeotti at Mirador give the following measurements. *Dorsal sepal* about 6 mm. long, orbicular-oblong, acute. *Lateral sepals* 11 mm. long, 4.5 mm. wide. *Petals*: posterior division 8 mm. long, 1.5 mm. wide, falcate-linear; anterior division 13 mm. long. *Middle lobe* of the labellum 14 mm. long. *Lateral lobes* basal. (PLATE 74.)

Am. 3: 306 (1884); *Kränzl.*, in Engl. Bot. Jahrb. 16: 98 (1893), Orch. Gen. et Sp. 1: 253 (1897).—*H. lactiflora* *Hems.*, Biol. Cent. Am. 3: 305 (1884) as to specimen cited.

“96. *H. diffusa* Nob. Foliis sessilibus elliptico-acutis; flor. viridibus, sepalis internis lanceolatis, appendice lineari ascendente: labelli laciniis lateralibus linearibus, intermedia latiori breviori, calcare ovario longiori.” Rich. & Gal. *loc. cit.*

In Lindley’s herbarium there is a duplicate of a Galeotti specimen which is identified as *H. diffusa*. Lindley’s drawing of a flower resembles very closely Richard’s drawing, which was presumably prepared from Galeotti’s no. 5150, although it shows longer anterior divisions on the petals. Measurements from Galeotti’s no. 5150 are as follows:

*Plant* 3.4 dm. tall. *Leaves* about 7 cm. long, 1.5–2.5 cm. wide. *Raceme* 9.5 cm. long, rather loosely flowered. *Ovary* 18 mm. long, very slender; *bracts* about half as long (up to  $\frac{2}{3}$ ). *Dorsal sepal* 5 mm. long. *Lateral sepals* reflexed, 7 mm. long, 3 mm. wide. *Petals* shorter than the dorsal sepal, the anterior divisions 5–5.5 mm. long and equal to the lateral divisions of the labellum. *Middle lobe* of the *labellum* wider than the lateral lobes. *Spur* about 1.7 cm. long.

*H. novemfida* Lindl. presents for consideration a remarkable example of inaccuracy of observation. The petals as described by Lindley are 3-parted. In Lindley’s herbarium there is a sketch which shows this character and beside which is written “verified Aug., 1854.” Dr. Prain kindly examined the original specimen

ORCHIDACEÆ

*H. diffusa* at my request, and reported that a flower moistened and carefully removed from the type has *bifid petals*, and that Lindley's drawing is clearly erroneous. In the light of this correction *H. novemfida* appears to be closely allied to *H. diffusa*, to which species I believe it should be referred. (PLATE 75.)

“*H.* foliis oblongo-lanceolatis acutis, floribus distantibus, bracteis foliaceis acuminatis cucullatis ovarii longitudine, petalis bipartitis: laciniis anterioribus filiformibus rectis reflexis galea brevioribus, labelli tripartiti laciniis filiformibus æqualibus, sepalis lateralibus pendulis supremo æqualibus, calcare filiformi compresso recto pendulo ovario duplò longiore.

“Hab. in *Mexico*, ad S. Pedro, Oaxaca, de *Karwinski* (*exam. s. sp. in hb. Mart.*)

“Caulis subflexuosus, 9 poll. altus, foliis sensim in bracteis de-crescentibus.” Lindl. *loc. cit.*

Lindley's herbarium contains a sketch of a plant and a flower, labelled “Mexico,” probably from the type, as he was in the habit of sketching types that were loaned him, especially Karwinski's. On the same sheet is a specimen from Orizaba by Botteri, and under *H. clypeata* (so referred by Kränzlin) a specimen collected at “Anganguero, Hartweg.” This is labelled “*clypeata* var.?” by Lindley, and is the *H. clypeata* var. in Bentham's *Plantæ Hartwegianæ* 53 (Hartweg no. 399), as shown by specimens in the British Museum. Although similar to *H. clypeata* it may be known by its looser habit, green flowers, shorter spur, narrower mid-lobe of the lip, which is shorter than the laterals and basal. (A. A. E.)

*H. diffusa* and *H. flexuosa* are closely related species which are often extremely difficult to distinguish from one another. The leaves of *H. diffusa* are larger than those of *H. flexuosa* and the structure of the flowers offers slight differences, but these characters may prove to be very variable and unreliable for specific distinction.

ORCHIDACEÆ

In a series of specimens referred to *H. flexuosa* the leaves average about 4 cm. in length. *H. flexuosa*

Pringle's no. 4806 collected in the state of Oaxaca resembles *H. subauriculata* so closely that it can be separated with certainty from it only by means of the bifid petals and by the lateral divisions of the labellum which are directed forward and not reflexed. Habitally it is almost a counterpart of *H. subauriculata*, and if it were not for several well marked differences in the flowers the two could be distinguished from one another only with extreme difficulty. The nearest affinity of *H. felipensis* is *H. flexuosa*, which is larger in all its parts and taller. Pringle's no. 4806, which constitutes the type, was originally distributed as *H. flexuosa*, and in Kränzlin's *Orchidacearum Genera et Species* is referred to the synonymy of *H. clypeata*, with which it has very little in common. (PLATE 77.)

in the Gray Herbarium of Harvard University.  
The flower, enlarged, was drawn with the aid  
of the camera lucida.

ORCHIDACEÆ

*H. guadalajara* spur clavate, equalling the ovary: processes nearly a line long; appendages at the base of the column very thick and verrucose. Guadalajara, in wet bottoms; August. (276.)—Flowers greenish yellow. With this in the Cambridge set is a small specimen with fewer and smaller flowers and narrower acuminate leaves, which belongs to some other species." Wats. *loc. cit.*

All other specimens of Palmer no. 276 which have been examined are of the small species mentioned by Watson, and appear to be related to *H. subauriculata*. Kränzlin reduces both this and *H. jaliscana* to *H. clypeata*, apparently without having seen the types.

*Habenaria guadalajara* is a very distinct species. The type specimen in the Gray Herbarium is about 2.6 dm. tall, with rigid, ovate-lanceolate, appressed leaves. The spurs are distinctly clavate, slightly exceeding 1 cm. in length. I have only seen three collections of this species, four plants in all, which are undoubtedly *H. guadalajara*. (PLATE 76.)

60. *H. stricta* Rich. & Gal., in Ann. Sci. Nat. ser. 3, 3: 29 (1845). *H. stricta* Not Ridl., in Journ. Linn. Soc. 21: 510 (1886).

“104. *H. stricta* Nob. Fol. lanceolatis strictis; flor. parvulis viridibus: labello oblongo, obtuso, calcare recurvo brevi.” Rich. & Gal. *loc. cit.*

This species has been ignored by later writers. There appears to be no specimen at the Museum of Paris, but there is a drawing of a flower and ovary, petal, gynostemium and lip. From this it appears to be a *Euhabenaria* with simple lip and petals, and would be related to *H. odontopetala*. (A. A. E.)

The drawing of a flower of *Habenaria stricta* exhibits a species which, as Eaton suggests, appears to be related to *H. odontopetala*. The labellum, however, is ligulate, acute, and probably entire at the base, which is obscured by the elongated, fleshy, stigmatic processes. The petals are not toothed, and as shown in Richard's drawing are lanceolate and 3-nerved. The slender spur is longer than the labellum and subequal to the ovary. (PLATE 78.)

ORCHIDACEÆ

“Usque tripedalis. Folia sicca papyracea oblongo-ligulata acuta *H. eustachya* numerosa, usque ultra pollicem lata, superne decrescentia. Racemus elongatus pedalis dense cylindraceus. Bracteæ triangulæ acuminatæ basi flores æquantes, superne minores. Sepalum impar concavo galeatum ellipticum obtuse acutum. Sepala lateralia triangula lata. Tepala ligulata apice varia (cf. supra), basi angulo obtuso seu acuto versus labellum. Labellum lineari-ligulatum basi latius, nunc utrinque angulatum. Calcar a basi teneriori ampliatum acutum. Canales loculorum antheræ arcuati, varie longi. Crura stigmatica brevia.

“Inflorescentia illi *Platantheræ dilatatæ* Lindl. similis.

“Prope Maricao, XI. 1884. Nr. 511 b.” Reichb. f. *loc. cit.*

In 1903 I described a Cuban species in the *Proceedings of the Biological Society of Washington*, naming it *H. Sanbornii*. At that time I was unable to obtain satisfactory material of *H. eustachya*, and judged that the specimens described by Reichenbach were different from mine.

*H. eustachya* is readily distinguished from *H. odontopetala* by its shorter spur and different labellum. In Cuba both species are frequently found growing together on forested slopes, *H. eustachya* blooming later than *H. odontopetala* in Pinar del Rio Province.

*H. troyana*, Fawcett & Rendle, is a closely allied species from Jamaica.

In my herbarium there are several flowers taken from numbers 511 b and 2880 of the collections made by Sintenis (cf. original description above). These flowers closely resemble the types of *H. Sanbornii* and *H. troyana*.

“Caulis subrobustus, foliatus. Folia lanceolata, acuta, amplexicaulia, vaginantia, superne bracteiformia. Racemus elongatus, densus. Bracteæ ovato-lanceolatæ, subacuminatæ, foliis superioribus conformes. Pedicelli breves. Sepala reticulato-nervosa; medianum ovato-suborbiculare, obtusissimum, cucullatum; lateralia semi-ovata, obtusa, patentia, mediano longiora. Petala integra, oblonga, retusa, basi obliqua, basim versus quam apice latiuscula et antice lobo obsolete instructa. Labellum simplex, lineari-ligulatum, basi angulatum; calcare pendulo, leviter cur-

<sup>1</sup>No. 3995 in herbaria 2 and 3 is represented by *H. monorrhiza* in fruit.

ORCHIDACEÆ

vato, a basi tenui superne robustiore, quam ovarium pedicellatum breviori; processibus stigmaticis brevibus, compressis; antheræ canalibus subæqualibus, leviter curvatis. *H. troyana*

“Plant 6 dm. l. Leaves about 10 cm. l., about 2.5 cm. br. Raceme 3 dm. l. Bracts 3.5–1.2 cm. l., 1.3–.6 cm. br. Sepals, median 6 mm. l., 5 mm. br., lateral 7 mm. l., 3.5 mm. br. Petals 5 mm. l., 2.3 mm. br. Lip 8 mm. l., 1.75 mm. br. near apex, rather over 2 mm. br. near base. Spur 9 mm. l.

“*Hab.*—In damp shady forest; in flower, Nov.; near Troy, 2500 ft., 10,432, *Harris!*

“Differs from *H. Sanbornii* Ames in the smaller, narrower, less membranous leaves, and the larger flowers with clavate, not filiform, spur. *H. Sanbornii* is a larger, coarser-growing plant. Very near *H. eustachya* Reichenb. f. in Ber. Deutsch. Bot. Ges. iii. 274 (1885), from Porto Rico (Sintenis, no. 511*b*), which, however, has the median sepal elliptical and obtusely acute. We have not seen this number of *H. eustachya*, and possibly *H. Sanbornii* may prove to be the same species.” Fawcett & Rendle, *loc. cit.*

I have seen flowers of this species submitted for examination by Dr. Rendle. They closely resemble flowers of *H. eustachya* Reichb. f. as represented by Cuban material in my herbarium. The spur is more decidedly inflated and the sepals and petals larger than in the older species. The character of the leaves on which the authors of *H. troyana* lay emphasis in differentiating it from *H. Sanbornii* (which I refer to *H. eustachya*) is of questionable value, as the measurements they give apply in detail to specimens of *H. Sanbornii*. In the Gray Herbarium there is a specimen from Orizaba, Mexico, collected by Botteri, which is intermediate between *H. troyana* and *H. Sanbornii*, and leads to the supposition that *H. troyana* is perhaps only

ORCHIDACEÆ

*H. troyana* a variety. The Mexican plant has inflated spurs, and slightly larger flowers than the type of *H. Sanbornii*. In the note which accompanies the description of *H. troyana*, *H. Sanbornii* is referred to as a larger, coarser-growing plant. This statement needs modification, as *H. Sanbornii* varies to an extraordinary degree in its dimensions, ranging in height from 3 to 8 dm., with leaves from 8 to 18 cm. long, exclusive of the uppermost ones, which pass gradually into the bracts that subtend the raceme.

In my opinion *H. troyana* is very near *H. eustachya*, and is probably the same species.

*H. replicata* 63. *H. replicata* A. Rich., in Sagra Fl. Cub. 2: 250, t. 86 (1850);<sup>1</sup> Griseb., Cat. Pl. Cub. 271 (1866); Sawv., Fl. Cub. 233 (1873); Kränzl., in Engl. Bot. Jahrb. 16: 212 (1893), Orch. Gen. et Sp. 1: 434 (1898); Cogn., in Urban Symb. Antill. 6: 308 (1909). Not *H. replicata* Hochst. in Rich. Tent. Fl. Abyss. 2: 296 (1851).

“H. caule erecto gracili sesquipedali: foliis lanceolato-linearibus acutis, basi laxe vaginantibus, brevibus, erectis, cauli appressis; floribus parvulis spicatis; bracteis foliaceis lanceolatis acutis, ovario dimidio brevioribus; ovario elongato apice sensim attenuato et inde rostrato; sepalo supremo convexo, subgaleato, apice obtuso; lateralibus externis dependentibus oblique et inæquilateraliter ovalibus subacutis apice incrassatis; internis (petalis) oblongo-lanceolatis exappendiculatis internæ supremi faciei lateraliter applicatis; labello dependente, sepalorum laterali longitudine oblongo, angustato, apice incrassato incurvo,

<sup>1</sup>There is another edition of this work, bearing the date 1853 on the title-page of the volume in which *H. replicata* is described. Richard's *Flora Cubana* composes volumes 10 and 11 of the *Historia Fisica, Política y Natural de La Isla de Cuba*, by D. Ramon de la Sagra. These volumes are usually cited as 1 and 2. The end of volume 10 (p. 319) closes with “fin del tomo primario.” *H. replicata* is described in volume 11 of the complete work.

## ORCHIDACEÆ

supra basin hinc et illinc dente brevi aucto; antherarum cruribus elongatis versus stigma crassissimum replicatis; calcare elongato, gracili ovarium æquante.

“Crescit in sylvis insulæ Cubæ.

“*Observaciones.* Esta planta entra en la division de las *Rostratæ* de M. Lindley, por su ovario sentado muy adelgazado en el vértice. Pero, todas las especies de *HABENARIA* citadas por el célebre botánico en la dicha division de su *Genera and Species Orchideous Plants*, son originarias del antiguo continente, y la muestra es distinta, no solo por el conjunto de los detalles de su organisacion, sino por su *habitat.*” Rich. *loc. cit.*

In this species the lateral lobes of the labellum are obtuse and arise from near the middle.

ORCHIDACEÆ

ad apicem caulis versus sensim decrescentibus; racemo oblongo *H. Selerorum* vel cylindrico laxo p[er]ifloro; bracteis ovatis acutis vel acuminatis ovario graciliter pedicellato multo brevioribus; floribus viridi-flavescentibus illis *H. alatae* Hk. fere æquimagnis; sepalo intermedio suborbiculari obtuso, 0.6 cm. diam., cucullato, sepalis lateralibus deflexis obliquis late oblongis apice breviter acuminatis 0.6 cm. longis, medio fere 0.4 cm. latis; petalis erectis oblongis apice truncato-obtusissimis, carnosulis, basi haud dentatis, 0.5 cm. longis, medio fere 0.2 cm. latis; labello deflexo, lineari obtuso, basi interdum utrinque denticulo minuto donato, 0.8 cm. longo, vix 0.2 cm. lato, carnosulo, calcare filiformi acuto dependente, ovarium bene excedente, c. 3 cm. longo; anthera emarginata, canalibus gracilibus adscendentibus; rostello humili, lobo intermedio triangulari obtusiusculo carnosulo; processibus stigmaticis crassis, clavatis, canalibus antherarum duplo brevioribus, apice cohærentibus; capsula clavata, glabra, pedicellata.

“Habitat in Guatemala, in provincia Alta Vera Paz, ad margines silvarum prope Coban: Sel. n. 2492.—Dec.” Schltr. *loc. cit.*

I am indebted to Professor Kränzlin for a sketch of this species. Kränzlin suggests that *H. Selerorum* is very near “*H. monorrhiza*” (*H. alata* of this work), but that a sure determination on this point is impracticable owing to the poor condition of the flowers on the specimen he examined. I have seen no material.

The truncate obtuse petals may prove to be a constant differentiating character when this species is compared with *H. alata*. In general habit, *H. Selerorum* as shown by Kränzlin’s sketch very closely resembles *H. alata* Hook., and should be rigidly compared with it.

ORCHIDACEÆ

*H. brevilabiata*

67. *H. brevilabiata* Rich. & Gal., in Ann. Sci. Nat. ser. 3, 3: 29 (1845).

“*H. brevilabiata* Nob. Fol. lanceolatis; flor. viridibus: labello oblongo-angusto, obtuso.” Rich. & Gal. *loc. cit.*

*Plants*, arising from fleshy tuberoids, about 1.6 dm. tall. *Leaves* lanceolate, acute, 4.5–6.7 cm. long, 1.4–1.7 cm. wide. *Floral bracts* equalling the ovaries, lanceolate, acute, the lowermost one nearly 2 cm. long. *Flowers* 5 or more, comparatively large. *Lateral sepals* elliptic-oblong, rounded at the tip, 3-nerved, 1 cm. long, 4 mm. wide. *Upper sepal* elliptical, concave, about 1 cm. long. *Petals* oblong, obtuse, about 8 mm. long, 2.75 mm. wide. *Labellum* ligulate, obtuse, fleshy, entire, 11 mm. long, 2 mm. wide. *Spur* about twice as long as the labellum, somewhat dilated near the apex, 2 cm. long. *Stigmatic processes* comparatively small.

My description is drawn in part from the type and in part from the specimen collected by Pringle in the state of Michoacán. The leaves of the type are broken. The longest one measures 4.5 cm. in length. The spur on the lowermost flower of Galeotti's specimen is 2 cm. long. The two specimens cited below are the only ones of which I have any knowledge. *H. brevilabiata* is apparently a very distinct species, which on account of its simple labellum and petals I refer to the group represented in our range by *H. alata* and its allies.

ORCHIDACEÆ

PLATE 79. *Habenaria brevilabiata*

I. Plant, natural size, drawn from Pringle's no. 11,911. II. Reduced from a photograph of the type. 1. Column etched from a photograph of Richard's drawing. 2. Column from Pringle's no. 11,911. 3. Labellum from Pringle's no. 11,911.

*H. odontopetala* Jahrb. 16: 183 (1893), Orch. Gen. et Sp. 1: 392 (1898); *Ames*, in Proc. Biol. Soc. Wash. 16: 117, f. 2 (1903), Orch. Fl. Fla. 12, t. 2 (1904).—*H. Garberi* *Porter*, in Bot. Gaz. 5: 135 (1880); *Chapm.*, Fl. S. U. S. ed. 2, 654 (1884); *Small*, in Bull. Torr. Bot. Cl. 27: 275 (1900).

*Platanthera Garberi* *Chapm.*, Fl. S. U. S. ed. 3, 486 (1897).

*Habenaria Michauxii* *Kränzl.*, Orch. Gen. et Sp. 1: 896 (1901) in part, not *Nutt.*

*Habenella Garberi* *Small*, Fl. Se. U. S. 316 (1903).

“*Habenaria* (§2. *Henidia*. a. in Lindl. Gen. et Sp. Orch.) *odontopetala* G. Rehb. fil. foliis lanceolatis acuminatis, racemo multifloro elongato, floribus pedicellatis, pedicellis bracteis lanceolatis acuminatis æqualibus, sepalis oblongis obtuse acutis, petalis paulo minoribus oblongis apice sinuato tridentatis, basi bidentatis, dente inferiore majore, labello lineari apice retuso, calcare filiformi clavato germini pedicellato subæquali, canalibus stigmaticis tenuissimis porrectis, processibus stigmaticis parvis obtusis.

“Stengel vielblättrig, 20" hoch. Blätter in der Mitte etwa 9" breit, 3" lang. Blüten von der Grösse derer der *Platanthera chlorantha*, gelb, nach der schriftlichen Notiz des Sammlers.—Temperirtes Mexiko. Leibold.” *Reichb. f. loc. cit.*

*H. odontopetala* is readily distinguished from *H. strictissima* by its oblong petals which are characterized by a tooth at the summit and by protuberant anterior basal angles. From *H. eustachya* it is to be separated by its longer spur and different labellum. In Cuba *H. odontopetala* grows on forested slopes. In Florida I have found it on the edges of wooded areas, mostly in shade. There is no adequate reason for upholding *H. Garberi*. It is clearly referable to *H. odontopetala*.

Dr. Small's new genus *Habenella* is in my estimation unnecessary and is founded on characters which are sectional rather

## ORCHIDACEÆ

than generic. It is inadvisable to segregate from *Habenaria* the species characterized by simple petals and lip. The direction of the stigmatic processes on which Dr. Small relies, in part, for the separation of *Habenella* from *Habenaria* does not in my opinion have sufficient value for generic distinction.

### NICARAGUA, SEGOVIA

*Oersted* 1/48. The lower portion of a stem, two or three flowers in a pocket, and a drawing of a flower and column, in Lindley's herbarium. It has not been reported since.

**71. *H. virens* Rich. & Gal.**, in Ann. Sci. Nat. ser. 3, 3: 29 (1845). *H. virens*

"105. *H. virens* Nob. Fol. elliptico-oblongis acutis; flor virid-

ORCHIDACEÆ

*H. virens* ibus numerosissimis, sepalo supremo galeæformi medio cristato, sepalis internis spathulatis: labello lobis lateralibus acutis, intermedio dimidio brevioribus." Rich. & Gal. *loc. cit.*

This very distinct species has been ignored by subsequent writers. There are three sheets and an excellent drawing of a flower with dissections at the Muséum d'Histoire Naturelle de Paris. *H. virens* has exactly the appearance of *H. strictissima*, but the *labellum* and *petals* are very distinctive. The *lateral lobes*, or teeth, of the *lip* are acute and directed forward. The *spur* is peculiarly up-curved in all the specimens. *Dorsal sepal* orbicular, 5 mm. × 5 mm., *lateral sepals* 7 × 5 mm., *petals* rounded, spathulate, 3 mm. long, lip 9 mm. long, linear beyond the side lobes, blunt, usually appearing as if broadened at the tip, because of revolute edges. (PLATE 78.)

MEXICO, OAXACA

1842, *Ghiesbreght* (21), (type).

*H. strictissima* 72. *H. strictissima* Reichb. *f.*, in Linnæa 18: 407 (1844), 28: 381 (1856); *Hems.*, Biol. Cent. Am. 3: 306 (1884); *Kränzl.*, in Engl. Bot. Jahrb. 16: 184 (1893), Orch. Gen. et Sp. 1: 392 (1898).—*H. pyramidalis* Lindl., in Ann. Nat. Hist. 15: 386 (1845); *Kränzl.*, in Engl. Bot. Jahrb. 16: 185 (1893), Orch. Gen. et Sp. 1: 393 (1898).

"*Habenaria* (§ 2. *Henidia*. a. in Ldl. Gen. et Sp. Orch.) *strictissima* G. Rchb. fil. foliis oblongis acutis arrectis in bracteis decrescentibus, spica densissima elongata, bracteis lanceolatis ovariis subæqualibus, sepalis petalisque minoribus oblongis obtusis, sepalo superiore cum petalis galeato, labello lineari basi bidentato, dentibus divaricatis, calcare filiformi pendulo ovario longiore, canalibus stigmaticis elongatis, processibus stigmaticis brevibus obtusis.

## ORCHIDACEÆ

“Der dicht beblätterte Stengel ist 18" hoch, die untersten, *H. strictissima* längsten Blätter 9''' breit, 3" lang. Die Aehre ist ausserordentlich reich-und dichtblüthig. Die Blüthen von der Grösse derer der *Platanthera bifolia*; grün, nach Angabe des Sammlers.

“Temperirtes Mexiko. Leibold.” Reichb. f. *loc. cit.*

*Habenaria strictissima* is clearly distinguished from *H. odontopetala* by its rounded petals which are about as broad as long, scarcely toothed at the tip, and obscurely if at all protuberant on the anterior basal corner. The labellum of *H. strictissima* is variable with regard to the basal teeth. These are sometimes pronounced and sometimes almost obsolete. When strongly developed they resemble those of *H. virens*.

*H. alata* *Orchis foliosa* Spreng., Syst. Veg. 3: 688 (1826); *Steud.*, Nomencl. ed. 2, 2: 223 (1841), not Sw.<sup>1</sup>

*Habenaria brachyceras* Lindl., Gen. & Sp. Orch. 315 (1835), not Spreng.—*H. bidentata* Pæpp., Enum. Pl. Cub. mss. ex *Steud.*, Nomencl. ed. 2, 1: 716 (1841).—*H. monorrhiza* Cogn., in Urban Symb. Antill. 6: 307 (1909).

“*Habenaria alata*; tuberibus subsphæricis, labello basi bidentato petalisque duobus interioribus minoribus lanceolatis, tribus exterioribus ovatis subpatulis, germine alato, cornu lineari-compresso germine brevior.

“*Root* fibrous, and having one or two small, nearly spherical tubers. *Stem* 1 to 1½ foot high, erect, leafy. *Leaves* lanceolate, acuminate, carinate, erect, glabrous.

“*Spike* about 4 inches long, consisting of many, rather densely placed flowers, each accompanied with a lanceolato-subulate bractea. *Corolla*: with the petals scarcely patulous, the 3 outer ones ovate, free, the inner smaller, lanceolate; the *lip*, which is never pendent, but at most standing forward, is the same size as the inner petals, lanceolate, and has a tooth on each side at the base, whilst on the under side, it runs down into a curved compressed horn, nearly as long as the germen. *Column* very short, thick, projecting forward, and with two tuberculated processes. *Anther*, with the two cells distinct, their bases elongated, so as to reach the tuberculated processes: *Pollen-masses* oval, upon a very long, green, filiform, elastic stalk, having a round gland at the base. *Germen* oblongo-clavate, slightly twisted, furrowed; the six angles of the furrows extended into as many longitudinal winged processes.” Hook. *loc. cit.*

<sup>1</sup>Sprengel (*loc. cit.*), and after him Steudel, supposed *Orchis foliosa* Sw. was incorrectly ascribed to Africa and identified it incorrectly with *Habenaria alata* Hook. The Swartzian species is now *H. foliosa* Lindl. from Cape of Good Hope. Correvon (*Orch. Rust.* 140) refers *O. foliosa* Soland. to *H. alata* Hort.

## ORCHIDACEÆ

My Cuban collections of this species were made in grasslands *H. alata* near the Sierra de los Orgaños Mountains in Pinar del Rio Province. In February the specimens were maturing their fruit and the perianth was partly withered. The specimens gathered by Pringle in Mexico were found on grassy hillsides. It would seem that *H. alata* prefers sunny locations in the open country, and grows mostly in savannas.

In Lindley's herbarium at Kew under *H. brachyceras* two specimens are preserved which I have referred to *H. alata*. One of these, which is very similar to Pringle's no. 3897 in the Gray Herbarium, is marked "Jamaica, Purdie. R. 27." It has the characteristic ovary of *H. alata*, and linear-lanceolate leaves. The other specimen was collected by Hooker in Jamaica and is accompanied by a note which refers it to *H. alata* Hook.

Folia intense viridia, tenuiter multinervulosa, limbo 7–11 cm. longo et 5–8 mm. lato, vagina 2–4 cm. longa. Racemus 4–9-florus, 5–10 cm. longus. Bracteæ foliaceæ, 1–2 cm.

ORCHIDACEÆ

*H. Dussii* longæ. Sepala membranacea, dorsale 4 mm. longum et  $3-3\frac{1}{2}$  mm. latum, lateralia  $4\frac{1}{2}-5$  mm. longa et  $2\frac{1}{2}$  mm. lata. Petala erecta,  $3-3\frac{1}{2}$  mm. longa,  $\frac{2}{3}$  mm. lata. Labelli lobus terminalis strictus, tenuiter trinervulosus,  $4\frac{1}{2}-5$  mm. longus, basi  $1\frac{1}{2}$  mm. latus; lobi laterales vix arcuati,  $2\frac{1}{2}$  mm. longi; calcar 4 mm. longum, inferne 1 mm. latum.

“Flores virides. Fl. IX–XII; fr. X.

“Hab. in Guadeloupe in sylvis humidis ad Nez-Cassé: Duss n. 3931.” Cogn. *loc. cit.*

I have seen a single flower of this species taken, presumably, from the type specimen in Urban's herbarium and given to me by Professor Cogniaux. This flower shows clearly the affinity of *H. Dussii* with *H. alata*, although the ovarian wings are not so strongly developed as in that species.
